

Synadia raises \$25 million for AI-driven edge computing expansion

Synadia Communication has secured US\$ 25 million in Series B funding to fuel the expansion of NATS.io, its pivotal platform enabling companies to extend digital services to the edge. The funding round was spearheaded by Forgepoint Capital, with contributions from existing and new investors, including Singtel Innov8, LDVP, and the 5G Open Innovation Lab. Forgepoint's managing director, Ernie Bio, will join Synadia's board of directors as part of the investment.

Ernie Bio highlighted the growing shift of companies towards edge computing to enhance customer and operational responsiveness in terms of speed and data management. He praised the company's rapid growth and customer adoption, attributing it to the platform's flexibility, reliability, and secure-by-design architecture, which aligns with the industry's demand for improved performance.

Founded in 2017 by Derek Collison, the creator of NATS, Synadia has quickly emerged as a leader in developing and supporting highly available, low-latency applications and microservices for multi-cloud and edge environments. Collison emphasised that with the backing of Forgepoint Capital and other investors, the company is well-equipped to provide real-time and secure access to services and data across various geographies, cloud providers, and edge locations. This funding round validates the company's product-market fit, propels its momentum, and highlights the potential to advance modern distributed systems further.

According to the recent edge spending guide, the global edge computing market is projected to reach US\$ 250.6 billion by 2024, with a compound annual growth rate (CAGR) of 12.5% from 2019 to 2024.

BharatGPT and SML to launch Hanooman, Indic LLM trained on 22 Indian languages

Seetha Mahalaxmi Healthcare (SML), in collaboration with the IIT Bombay-led BharatGPT ecosystem, has announced the launch of 'Hanooman' -- a series of Indic large language models trained on 22 Indian languages. Vishnu Vardhan, the founder of SML, revealed that they have developed an enterprise-ready family of foundational language models ranging up to 40 billion parameters in size.

The first four models in the series, with 1.5 billion, 7 billion, 13 billion, and 40 billion parameters, will be released soon and will be open sourced. Currently, the models can respond in 11 Indian languages, including Hindi, Tamil, Telugu,

Proxmox Mail Gateway 8.1 comes with enhanced security

Proxmox Server Solutions GmbH has announced the release of Proxmox Mail Gateway 8.1.

This latest version of their open source email security solution is based on Debian 12.5 and features Linux kernel 6.5, ZFS 2.2.2, and PostgreSQL 15.6. The Mail Gateway 8.1 is a comprehensive mail proxy between the firewall and internal mail server, safeguarding organisations from threats like spam, viruses, Trojans, and phishing emails. Key enhancements in this release include:

- An improved rule system for flexible mail flow control
- Optional DKIM signing based on header information
- Support for secure boot to ensure the integrity of the boot process

The web interface has been updated with a new filter and search box, making it easier to manage large deployments. Croatian and Georgian translations have been added, along with improvements to other language translations. The company has also updated its kernel, renaming relevant packages to proxmox-kernel and proxmox-headers. This release addresses SMTP smuggling vulnerabilities and ensures that restoring a Mail Gateway backup does not interfere with creating a new cluster.

The release is available as an ISO download for installation on bare metal or virtual machines, with an installation wizard that automates the setup process. It can also be installed as a container appliance inside Proxmox VE. The company offers a subscription service for enterprise use, providing access to the stable Enterprise Repository for regular updates and technical support from the team. Subscriptions start at 175 Euros per host per year for unlimited users and domains.
