

Geary 44 introduces conversation list and headerbar tweaks

A new version of open source Linux email client Geary has been launched, bringing exciting updates to enhance the user experience. Geary has gained popularity among Linux users for its lightweight and user-friendly approach to email management. With support for popular email protocols like IMAP and SMTP, Geary seamlessly integrates with webmail services such as Gmail, Yahoo! Mail, and Outlook.

Geary 44 introduces a new conversation list and reworked headerbar, aiming to improve the email management process. While the exact details of the new conversation list remain undisclosed, it is expected to enhance the app's underlying structure. The reworked headerbar introduces a new 'Select' button alongside the 'Search' button, with rearranged toolbar icons in the message view.

Mobile users and those in narrow portrait mode on desktops will notice that the toolbar previously present at the bottom of the conversation list view has been removed, while the toolbar in the message composer view remains unchanged. Geary 44 also addresses various bug fixes and minor improvements, including network detection issues, engine suspension during system suspension, UI translation updates, and smaller UI enhancements.

It continues to evolve as a reliable email client for Linux users, offering threaded conversations, efficient search capabilities, and seamless integration with popular webmail services. As an open source project under the GNOME umbrella, Geary relies on community contributions and feedback.

modified the kernel's user mode stack expansion code to prevent the occurrence of the use-after-free condition. Torvalds admitted, "It's actually something we always technically should have done, but because we didn't strictly need [it], we were being lazy about things."

As a result of their efforts, the patches have been backported to kernels 6.1.37, 6.2.11, and 6.4.1, effectively resolving the StackRot bug on July 1st. However, with Linux kernel 6.3 reaching its end of life, users are strongly encouraged to upgrade to Linux 6.4, which includes the necessary fixes to mitigate the vulnerability.

ToolJet secures funding from Microsoft's M12 Fund and GitHub

Open source developers' platform ToolJet has successfully raised funding from tech giants Microsoft's M12 Fund and GitHub, according to a recent statement by the company. The investment is expected to drive workforce expansion and enhance the platform's artificial intelligence

(AI) capabilities.

In a bid to empower developers and simplify the process of building internal tools, ToolJet provides a low-code platform that allows users to create custom applications without extensive coding knowledge. With this recent funding, ToolJet aims to strengthen its position in the market and further advance its AI-powered features.

Navaneeth Padanna Kalathil, the founder and CEO of ToolJet, brings his expertise to drive the platform's success. Prior to ToolJet, Kalathil co-founded MobioPush, which was later acquired by Freshworks in 2015.

Microsoft's M12 Fund, the venture capital arm of the tech giant, focuses on investing in innovative startups with promising potential. ToolJet's inclusion in its portfolio demonstrates the company's recognition as an emerging player in the open source developer space.

GitHub, a widely-used platform for collaborative software development, has also shown its confidence in ToolJet's growth prospects. The strategic partnership between ToolJet and GitHub not only validates ToolJet's capabilities but also opens doors for potential synergies between the two platforms.

While the exact amount of funding received by ToolJet has not been disclosed, the investment is expected to provide the necessary resources to accelerate ToolJet's expansion plans. The infusion of funds will support the company in hiring top talent, enhancing its existing features, and driving innovation within the platform.

EU's A.I. Act will regulate the deployment of AI

The EU's ground-breaking A.I. Act is set to revolutionise the regulation of artificial intelligence. EU policymakers are in the final stages of implementing the world's first comprehensive framework for governing artificial intelligence. The forthcoming A.I. Act aims to shape the global development, deployment, and regulation of A.I., following the EU's influential General Data Protection Regulation (GDPR). As the EU establishes itself as a leader in tech regulation, policymakers worldwide are taking notice, including open source software developers.

The A.I. Act adopts a risk-based approach, setting requirements for AI systems in various sectors. Before deployment or sale, systems must meet criteria related to risk management, data transparency, documentation, oversight, and quality. Sensitive areas such as critical infrastructure and access to life opportunities in education and employment are classified as high-risk. Generative AI, like ChatGPT, also falls within
