

differences, and restore to a specific version if needed. This provides an added layer of project control and ensures that you can easily roll back changes if required.

Build process integration: CodePen Projects seamlessly integrates with build processes and task runners like Gulp or Grunt. It facilitates the developers to define custom build steps to transpile, minify, concatenate, or optimise code.

Hosting options: CodePen Projects offers multiple hosting options for projects. Developers can choose to host your project on the CodePen platform itself or export it to external hosting services like Netlify or GitHub Pages, which enables them to deploy and share the projects in various environments.

Custom domains: With CodePen Projects, developers have the option to use a custom domain for your project. This means developers can associate the project with a unique

domain name of your choice, enhancing the branding and accessibility of the web project.

Project collaboration permissions: CodePen Projects provides fine-grained control over collaboration permissions. Developers can define different access levels for team members, allowing you to specify who can edit files, who can view the project, and who has administrative privileges, which ensures proper control over a project's security and access rights.

CodePen Projects expands the capabilities of CodePen by offering a structured and collaborative environment for developing more complex web projects. It provides powerful features like file management, version control, build process integration, and hosting options, making it suitable for professional web development workflows.
