

SUSE to invest over US\$ 10 million in RHEL fork

Leading enterprise open source solutions provider SUSE has made a bold decision to fork Red Hat Enterprise Linux (RHEL). What this means is that SUSE will create and take care of an RHEL-compatible version that anyone can use, with no limitations. And to make this happen, SUSE has pledged to invest over US\$ 10 million in this project.

The decision to fork RHEL is rooted in SUSE's unwavering commitment to fostering an open source community built on collaboration and shared success. Dirk-Peter van Leeuwen, CEO of SUSE, emphasised the company's responsibility to uphold these values. He stated, "For decades, collaboration and shared success have been the building blocks of our open source community. We have a responsibility to defend these values. This investment will preserve the flow of innovation for years to come and ensures that customers and community alike are not subjected to vendor lock-in and have genuine choice tomorrow as well as today."

While SUSE remains fully committed to its highly regarded Linux solutions like SUSE Linux Enterprise (SLE) and openSUSE, it recognises the importance of providing enterprises and the open source community with the freedom to choose their preferred Linux environment.

SUSE says it is determined to collaborate with the open source community to develop a long-term, RHEL-compatible alternative. It plans to contribute this project to an open source foundation, ensuring free access to the alternative source code for everyone involved.

Dr Thomas Di Giacomo, chief technology and product officer at SUSE, emphasised the company's belief. According to him, "This collaborative effort demonstrates SUSE's deep-rooted commitment to fostering innovation and nurturing community-driven development, and it reinforces the fundamental values of open source software. We invite the community to actively engage and collaborate in shaping the future of this essential software. We firmly believe this new RHEL-compatible Linux distribution, together with SUSE's portfolio, will help the community and customers navigate unprecedented advancements in enterprise Linux, cloud computing, containerisation, edge, AI/ML and other emerging technologies."

Rust 1.71.0 release: Improved efficiency and exciting new features

The Rust programming language has recently released version 1.71.0, bringing with it a host of exciting updates. Rust is known for its focus on safety and performance. And it continues to evolve to meet the needs of developers.

Users who have previously installed Rust via Rustup can easily update to version 1.71.0 by running the command 'rustup update stable'.

The latest release includes the following key features:

- Stabilisation of the C-unwind ABI and other -unwind suffixed variants, ensuring safer unwinding operations across different programming languages.
- Support for debugger visualisation attributes, enabling library authors to embed Natvis descriptions and GDB scripts into their Rust libraries, improving the debugging experience.
- Raw-dylib linking support on Windows platforms, allowing the use of dynamic libraries without requiring their availability during the build process.
- Upgrade to musl version 1.2.3, enhancing dependencies without significant impact for most users.

Developers are encouraged to explore and take advantage of these new features and enhancements. By leveraging these updates, they can streamline their coding processes and unlock new possibilities in their projects.
