

Dell infrastructure adopts Hugging Face's GenAI models

Dell Technologies and Hugging Face, the generative AI language model supplier, have joined forces to integrate custom GenAI models onto Dell server and storage products. The partnership extends Hugging Face's influence beyond its renowned open source large language models, including Distilbert-sst-2-int8.

AMD and CloudFlare have previously aligned with Hugging Face. Now, Dell enters the fray, facilitating on-premise deployment of customised large language models through a dedicated portal on the Hugging Face platform.

Jeff Boudreau, Dell's chief AI officer, emphasised the partnership's benefits: "Dell Technologies' GenAI capabilities, combined with Hugging Face's collection of data sets and libraries, offer users the freedom of open source GenAI models with the peace of mind of on-premise data security and reliability."

Jeff Boudier, head of product and growth at Hugging Face, concurred: "This collaboration will empower companies to build their own AI systems leveraging the incredible innovations of the open source community, while benefiting from the security, compliance and performance of Dell systems."

The partnership ushers in the Hugging Face Dell portal, a platform enabling users to deploy open source models seamlessly on Dell servers and storage. Dell, solidifying its commitment to AI, recently unveiled the ObjectScale XF960 all-flash storage appliance and Dell Validated Designs for AI.

Hugging Face lists over 300,000 large language models in its catalogue. The platform provides pre-trained models, libraries, tools, and resources, simplifying AI utilisation.

Recently, both companies teamed up with other industry leaders to initiate the RISC-V software ecosystem (RISE). Qualcomm Technologies also disclosed its investment in a firm to further RISC-V hardware development.

Dino Bekis, vice president and general manager, wearable and mixed signal solutions, Qualcomm Technologies, said that they are excited to leverage RISC-V and expand their Snapdragon Wear platform as a leading silicon provider for Wear OS.

General manager of Wear OS by Google, Bjorn Kilburn, said that Qualcomm has been a pillar of the Wear OS ecosystem, providing high performance, low power systems for many of their OEM partners.

VNC releases VNClagoon 2.0, the collaboration software for enterprises

VNC has unveiled VNClagoon 2.0, an iteration of its modular software stack tailored for enhanced communication and collaboration. This highly scalable

application significantly reduces rollout and deployment times by leveraging Kubernetes-driven microservices and micro-modules. The backend optimisation ensures seamless operation in complex setups.

VNClagoon 2.0 has the native integration of all functional modules in the

front end. This innovation allows businesses to create customised workspaces for individual employees, teams, departments, or entire organisations, harnessing the power of the fluid principle. Modules and dashlets can be combined and rearranged as needed, giving users great flexibility. Users can choose to deploy the suite on-premise, in the cloud, or hybrid architectures.

Recognising the importance of partnerships, VNC has introduced tailored partner packages. These packages are designed to serve the diverse needs of partners in the indirect sales channel. They range from VNCbasic (P1), ideal for start-ups, small and medium-sized enterprises (SMEs), municipalities, and local authorities, to VNCprofessional (P5), which caters to large enterprises as well as federal and state authorities. VNCcharity (P0) offers a cost-effective solution for non-profit organisations. Partners can also leverage the white-labelling feature to customise VNClagoon 2.0 to their branding or clients' corporate identity.

Andrea Wörrlein, managing director of VNC in Berlin and a board member of VNC AG in Zug, emphasised, "VNClagoon 2.0 is suitable for virtually all sizes of companies and public authorities, from start-ups to large corporations, thanks to its modular design, infinite combination options, easy deployment, flexible provisioning, and end-to-end interoperability of modules and dashlets."

OpenAI's ChatGPT Plus unveils a host of new features

OpenAI is making waves in the world of artificial intelligence once again with the introduction of new features for its ChatGPT Plus, a generative AI chatbot. Among the notable additions is the 'advanced data analysis' feature, currently in the testing phase and available to select users on paid tiers.

One of the standout capabilities of this feature is its ability to allow users to seamlessly upload files within a conversation and work with them, all while being assisted by the AI-based chatbot. This functionality extends to the analysis and summarisation of data sheets that users upload. ChatGPT goes beyond
