

## Elon Musk envisions X as an open source news platform

In a significant development, Elon Musk, the visionary behind SpaceX and Tesla, is positioning X, formerly Twitter, as an open source news outlet. Musk is causing a stir by advocating for a community-driven approach to news sharing on this platform.

Responding to concerns about misinformation on X, Musk highlighted the role of Community Notes, a tool that allows users to annotate posts and provide context. He made a clear distinction between X and mainstream media, emphasising that X operates on an open source philosophy, providing an alternative to tightly regulated narratives found in traditional news outlets.

Musk firmly believes that all the crucial information from legacy media is already available on X, asserting the platform's position as a hub for relevant news and discussions. However, some users have expressed doubts about its effectiveness in combating misinformation. Concerns include delays in the appearance of annotations, which may allow misleading information to spread, as well as accusations that X may inadvertently promote misinformation targeting American institutions.

X has recently changed its news-sharing format, abandoning headlines in favour of showing only images and linked web domains. This shift raises questions about how news is perceived and shared on the platform.

Additionally, Musk has invited journalists to publish their work directly on X, with the promise of higher earnings, aiming to entice professionals in the journalism industry. Musk's push for citizen journalism on the platform, encouraging live video reporting from ordinary citizens, is another significant development.

## OpenText unveils an integrated partner network

OpenText has unveiled its integrated OpenText Partner Network. This consolidated network merges the partner ecosystems of both OpenText and the recently incorporated Micro Focus. This integration paves the way for enhanced support and expanded opportunities for a robust network of over 30,000 partners. Partners can tap into the company's extensive knowledge and wide-ranging

## Tektronix unveils Python driver package for test & measurement

Tektronix has introduced an open source Python-native driver package for test and measurement (T&M) instrumentation. The package, named `tm_devices`, offers a native Python user experience, empowering users with auto-complete, precise type hinting, built-in help, real-time syntax checking, and debugging capabilities.

Rick Kuhlman, GM, Portfolio Software, said, "We aim to enhance productivity with Pythonic development tools and code reuse, encouraging collaboration and customisation."

The `tm_devices` package seamlessly integrates across Tektronix and Keithley devices, ensuring users in the test and measurement sector have access to the latest features and improvements. It facilitates ongoing development and updates, creating a dynamic environment.

"Automation typically involves dated string-based command APIs with shortcomings," explained Kuhlman. The `tm_devices` package, however, providing a single-line, seconds-long installation for Python auto-completion, type hinting, and real-time syntax checking – all free and open source.

Designed for simplicity, the driver package is now an integral part of Tektronix's development pipeline, adding an extra layer of quality and scrutiny. "With a quick install, no prerequisites, or unnecessary dependencies, it's extremely easy to get up and running," said Kuhlman.

The `tm_devices` open source Python driver package is globally accessible, marking a significant stride in democratising advanced T&M instrumentation tools.
