

Giskard's testing framework focuses on AI regulation

French startup Giskard's open source testing framework, designed for large language models (LLMs), addresses biases, security gaps, and content risks, and is positioned as a critical tool for AI regulation.

Giskard's open source Python library integrates seamlessly into LLM projects, notably retrieval-augmented generation (RAG) projects. Compatible with tools like Hugging Face, MLFlow, and TensorFlow, it caters to the practical needs of developers.

Post-setup, Giskard assists in generating a comprehensive test suite covering performance, hallucinations, misinformation, biases, and harmful content generation. CEO Alex Combessie said, "You'll have the performance aspect, which will be the first thing on a data scientist's mind. But more and more, you have the ethical aspect, both from a brand image point of view and now from a regulatory point of view."

Developers integrate tests into the continuous integration and continuous delivery (CI/CD) pipeline for regular scrutiny. Any anomalies trigger a detailed scan report directly in the GitHub repository.

Giskard's second product, the AI Quality Hub, serves as a debugging tool, gaining traction with companies like Banque de France and L'Oréal. It aims to evolve into a comprehensive documentation generator, facilitating compliance with regulations. The third product, LLMon, acts as a real-time monitoring tool for LLM answers.

With 20 dedicated team members, Giskard is gearing up to be the leading LLM antivirus in the market.

information management capabilities by coming under a unified programme structure. This ensures they can provide top-tier solutions that bring value to enterprise clients.

The company is channelling resources into R&D to forge cutting-edge technologies that the partners can leverage. The aim is to aid global customers in enhancing and safeguarding their foundational data and information channels to harness artificial intelligence's power.

Its programme for enterprise partners offers globally uniform procedures and benefits, all aimed at fostering future growth. The cloud acceleration programme

is tailored for mid-market partners, and emphasises generating new business and expansion avenues via the company's public cloud solutions.

Then there is the aviator thrust for partners, a dynamic new proposition that enables partners to design bespoke solutions for clients, leveraging the company's

cloud API services. This is especially beneficial for clients embarking on their AI journey or crafting sector-specific solutions.

The SolEx programme allows partners to function as an extension of OpenText products, presenting solutions that cater to distinct market demands.

The OpenText Partner Network operates in 150 nations worldwide. The revamped network is now accessible to all qualifying partners.

Tidelift's open source insights strengthen cybersecurity and risk management

In today's evolving cybersecurity landscape, reacting to late-stage risks is no longer adequate. Timely and accurate information is essential for early action and cost-saving. Tidelift provides access to a meticulously curated feed of open source package insights, allowing users to generate reports in line with government cybersecurity regulations.

The company collaborates with open source maintainers to ensure compliance with new security standards. It pays maintainers for their efforts, offering organisations better risk management and software assurance.

Tidelift's subscription includes exclusive insights from open source maintainers,

consolidated and structured data from various package manager ecosystems, and enhanced human-researched data to provide more contextualised insights.

Moreover, Tidelift aligns with US government standards, confirming adherence to the NIST Secure Software Development Framework

(SSDF), which is crucial for government contracts. The subscription provides a standardised attestation report and an automated solution to actively monitor and maintain attestation records for open source components.
