

To assist organisations in managing and enforcing open source policies, Tidelift offers a software bill of materials within the subscription, creating a centralised inventory of open source components. This simplifies the identification of compromised packages when addressing vulnerabilities, ensuring the use of approved, secure components across all development teams.

iXsystems names Patrick Keane as vice president of engineering

iXsystems, the driving force behind TrueNAS open storage, has announced the appointment of Patrick Keane as its vice president of engineering, effective October 17, 2023. This move is a significant step forward for TrueNAS technology and the company's continued expansion in the market.

Keane's track record over two decades of tech leadership spans various industries, including direct marketing, telecommunications, broadcast media, medicine, data visualisation, and high-performance computing. He has a history of delivering enterprise storage solutions, having previously led engineering

teams at renowned organisations such as NetApp and, most recently, as vice president of engineering at Panasas, Inc.

Kris Moore, senior vice president of engineering at iXsystems, expressed excitement about this development: "Patrick's addition to our engineering leadership team brings valuable enterprise knowledge and experience to our company at an exciting time in the history of companies. More enterprise customers are adopting TrueNAS, and he will be instrumental in advancing the technology to serve in an expanding set of use cases in enterprise environments."

Keane's primary mission will be to drive innovation in iXsystems' storage solutions. He said: "I have been a TrueNAS enthusiast for years, both in my personal and professional life. TrueNAS is a stand-out product in the storage industry for its rich feature set, ease of use, and rock-solid reliability for enterprise customers and home users. The opportunity to collaborate with the open source community and the amazing team at iXsystems to drive TrueNAS innovation is a dream job."

Qualcomm to partner with Google for RISC-V based wearables

Semiconductor chipmaker Qualcomm has announced an extension of its long standing partnership with Alphabet's Google to make wearable devices using RISC-V technology. The wearables will have Google's Wear OS, which is an

Android operating system designed for smart watches and other wearables.

RISC-V is an open source instruction set architecture (ISA) that competes with ARM's proprietary ISA, which is a dominant choice for embedded systems and mobile devices.

Qualcomm announced its intention to launch the RISC-V-based wearables solution worldwide, including in the United States.

Fleet boosts Mac enterprise security

Fleet, the open source endpoint security company, has shaken up Mac enterprise security by integrating osquery for script execution on managed devices. This move addresses the needs of admins constrained by conventional mobile device management platforms.

Fleet, known for its open architecture and GitOps embrace, now enables IT departments to approve and execute script changes on demand. This development offers a flexible solution for businesses managing hybrid IT operations.

Co-founder Zach Wasserman, also the co-creator of osquery, emphasised Fleet's open source nature, providing business owners with a versatile approach to managing and protecting their IT infrastructure. He noted, "Fleet allows you to escalate from a read-only system to a script execution system, allowing for not just monitoring but remediation as well."

Wasserman underscored the advantage of an open source approach, steering away from the need to continuously add software to tackle problems. The aim is to provide a streamlined architecture that can easily adapt to new challenges.

In contrast to one-size-fits-all solutions, Wasserman believes Fleet offers the flexibility and freedom to adapt and grow without being locked into proprietary solutions, especially beneficial for businesses with budget constraints.
