

The motorcycle successfully underwent a full test-track demonstration in October 2023 and is poised for presentations at various conferences, steering clear of competitive racing. The project debuted at the Hydrogen Americas Summit and CES 2024, with future plans to appear at the World Hydrogen Summit in the Netherlands in May 2024.

Constructed over a year, the prototype rests on a 1999 motorcycle frame, with industry sponsor donations, including a fuel cell from South Korean company Doosan.

The team champions an open source ethos, documenting the build process in a guidebook, inviting riders to contribute actively. “Our project is ongoing as we explore the future of hydrogen and fuel cells in electric vehicles,” the team emphasised.

MIT’s commitment extends to making the design plan available online, fostering a community of motorcycle enthusiasts.

Scribus 1.6.0 unveiled for desktop publishing

In a groundbreaking move for open source desktop publishing, Scribus has unveiled its latest stable release, Scribus 1.6.0. This marks a monumental upgrade since 2019, and is loaded with “thousands of enhancements and fixes across all areas of the program,” according to the development team.

The rejuvenated Scribus features a revamped UI with fresh icons and support for light/dark modes. The speed and stability are touted as unparalleled, making it a go-to for professionals. The ‘Weld’ feature, a nod to Adobe Illustrator, streamlines object combining without the need for ‘grouping’.

This release offers an array of improvements like canvas rendering on high-density displays, an efficient Picture Browse plugin for graphic asset management, and an upgraded scripting engine. The Symbol Clone feature accelerates design, and canvas typing and text rendering see a significant speed boost.

Scribus 1.6.0 introduces experimental features for foot and end notes, text variables, and cross-references, showcasing its commitment to innovation. Compatibility is key, and Scribus ensures smooth file importing from various desktop publishing apps, making it a versatile tool.

For those eager to dive into the upgrade, Scribus 1.6.0 is available for Windows, macOS (including Apple Silicon), and Linux. Linux users can grab the latest release from the official Scribus SourceForge page, while an Ubuntu PPA is also an option.

Valve boosts gaming performance for Linux users employing AMD GPUs

Valve, the gaming giant behind Steam Deck, is making significant strides in enhancing gaming performance for Linux users employing AMD GPUs through its

Ozonetel releases Telugu SLM

Hyderabad’s Ozonetel, in collaboration with Swecha Movement, has unveiled ‘AI Chandamama Kathalu’, India’s inaugural Telugu Small Language Model. Contrary to Sam Altman’s reservations, Ozonetel crafted the model at a notably low cost.

“Upon Sam Altman expressing the challenge of building a ChatGPT clone, we were intrigued by the possibility. Viewing it as an opportunity, we decided to embark on this challenge and successfully crafted a contextualised model, beginning with the Telugu language,” shared Chaitanya Chokkareddy, Ozonetel’s CTO.

Ozonetel engaged 10,000 students in a datathon, translating 40,000-45,000 pages of Telugu folk tales. Despite exploring Meta’s Llama and Mistral, the team opted to build the model from scratch, similar to GPT-2. Training on NVIDIA’s A100 GPUs took a week, costing around \$1000.

Encouraged by its success, Ozonetel eyes more SLMs for education and coding, planning 5-6 datathons involving IIT Hyderabad, IIIT Hyderabad, and 20 engineering colleges.

Swecha Movement’s open source philosophy echoes in Ozonetel’s transparency. “We have disclosed everything about the Telugu SLM, including data sets, so others can build upon it,” emphasised Chokkareddy. Swecha considers a distinct licence for data set reusability, aligning with open source principles.

Chokkareddy aims to prove that building Indic Language Models is feasible. India has witnessed a surge in projects like Tech Mahindra’s Project Indus, Ola’s Krutrim, and Sarvam AI, focusing on Indic Language Models.
