

Rethinking Security: From Costly Obligation to Strategic Investment

Organisations need not look at security as a cost but, rather, as strategic investment. Here's a blueprint for security – from organisational vision to practical tools – that will help them build that perspective.

Recent technological advancements have significantly improved software security. Yet, a critical challenge persists -- the gap between security strategies devised in boardrooms and their real-world implementation. Often, these strategies lack the practical insights needed for seamless execution. This disconnect not only jeopardises an organisation's security but also its foundation.

To build secure software that remains so throughout its life cycle, organisations need a stakeholder-driven perspective in security strategy design, which acknowledges their feedback loops and aligns security objectives, actions and principles with technical and cultural challenges.

In this article, we present a transformative, yet simple and practical, depiction of the security strategy design that addresses

these issues head-on. The 'security perspectives framework' explores the four fundamental layers that form an organisation's software engineering landscape. Understanding these layers allows organisations to redefine asset protection, improve resilience, and transform security from a mere cost into a strategic investment.

So let's explore the layers of an organisational security strategy, covering policies and guidelines to
