

Where is Technology Headed in

2024?

Generative AI will continue to be the buzzword in 2024, and as organisations reach out for open source solutions, they will turn to the in-house open source program office.

The pace of innovation in technology has been breathtaking, and is expected to continue in 2024 with various open source technologies emerging across software infrastructure, machine learning (including AI), and data platforms. The constant evolution of the open source landscape promises to disrupt established norms, unlocking new possibilities. Generative AI was last year's buzzword, and that promises

to continue this year too. However, like everything else, it's going to evolve and take shape across industries. Every active developer around the world is always eager to experiment with the latest technology to advance their ability to deliver software value faster and more reliably. Although open source technologies are amazing to work with, they must make sense to businesses across industries; hence, the focus on industry solutions.
