

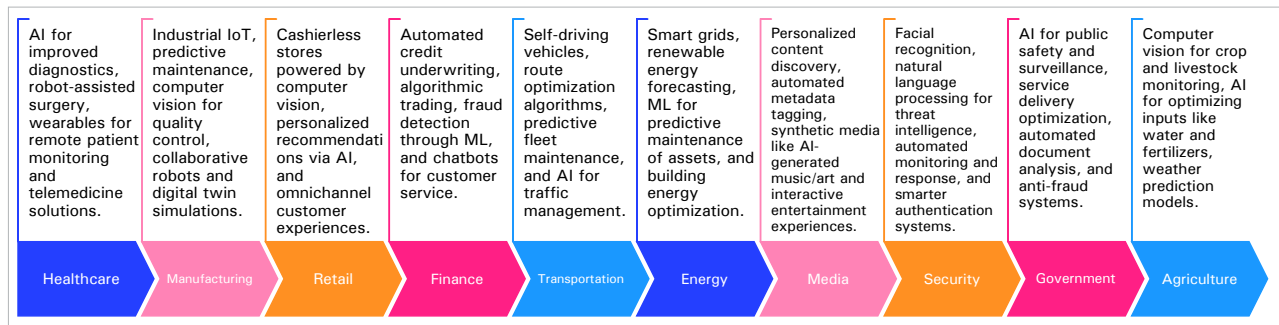

Figure 1: Industry trends – 2024

Industry trends

‘More for less’ has always been the mantra of corporations. With technology evolving rapidly, organisations are looking to advance their offerings with solutions that are unique and ubiquitous in their industry. The popularity of the cloud in the past decade has made organisations comfortable with investing in smart technology. This change has boosted startups to build applications leveraging open source at a speed never witnessed before. The infographic in Figure 1 looks at industry trends across healthcare, manufacturing, retail, finance, transportation, energy, media, security, government, and agriculture. Like any forecast, it’s an attempt at predicting the future based on the top business innovations in the past few years.

Multiple industries are embracing AI as core solutions. In healthcare, the use of robots has been evolving to address precision surgeries, remote patient treatments, and in agriculture, there’s a push towards computer vision for crop and livestock monitoring with AI. While industry-specific solutions take the spotlight, tech solutions relevant to every organisation like HR, sales, marketing, operations, etc, are also on the rise. New possibilities with generative AI, IoT, cloud and 5G are pushing automation and efficiencies in organisations to new heights.

Technology trends

As 2024 unfolds, GenAI promises to take the lead in technology trends across all industries. Gartner predicts AI to be

the frontrunner in 2024, moving beyond experimentation into implementations. Just like any other new technology, GenAI is going to have to prove itself as a safe and reliable technology that can generate business value with manageable risks. Many governance models and frameworks are evolving, with the US government publishing the broad guidelines that will play a major role in shaping the adoption of AI in 2024 and beyond.

Although AI is leading the trend, other tech is also trending, mainly with respect to the security of organisations’ assets across the SaaS landscape including cloud computing. Organisations always invest to add value to their core business. However, the increased complexities of managing ever growing data that’s spread across multiple service providers call for investing in security and the sustainable adoption of technology.

Virtual reality (VR) and augmented reality (AR) are once again in the news, gaining momentum with innovations improving everyday use cases. However, more must be done and, most importantly, accepted by a larger customer base for AR/VR to kick-off as a technology that has a big impact.

Open source tech trends

The vibrant open source ecosystem is constantly evolving. Many technology trends will take centre stage in 2024, some of which are already being widely adopted while others are still work in progress. Irrespective of where each of these technologies stands, one thing is certain — the robust open source community will continue to add value to enterprises of all kinds. Figure 3 illustrates open source tech trends in 2024; as you can see, the focus is on AI leading innovations in decentralised web, quantum computing, data science, and web development.
