

GuardRail OSS: Towards responsible AI

A consortium of enterprise software experts, led by Reuven Cohen, Mark Hinkle, and Aaron Fulkerson, has launched GuardRail OSS, a game-changing open source initiative for responsible AI development. The framework, equipped with advanced tools, ensures ethical AI by scrutinising data inputs, monitoring outputs, and guiding AI contributions. Reuven Cohen, the lead AI developer, said, “AI’s potential is only fully realised when anchored in responsible development.”

AI applications’ growing prevalence demands robust governance mechanisms, and GuardRail OSS answers the call. Transparent and customisable, it empowers enterprises to integrate emotional intelligence and ethical decision-making into AI systems across various industries. It tackles challenges through automated content moderation, EU AI Act compliance, bias mitigation, and psychological analysis of AI-generated content.

This open source project, with industry veterans leading the charge, champions responsible AI development. As AI continues to advance, initiatives like GuardRail OSS become indispensable, ensuring AI technologies benefit society while adhering to ethical principles.

Protectli unveils an open source UPS

In a collaboration between Ryan Walker of Interrupt Labs and Protectli, a groundbreaking open source uninterruptible power supply (UPS) is now on the scene. Powered by twelve 18650 batteries, this UPS is designed to offer a reliable

power source for DC devices during outages, setting itself apart with an open source approach.

The focus on simplicity is evident in the UPS’s 12V DC system, diverging from the complexity of traditional UPS designs. With distinct barrel-jack connectors for

input and output, user-friendly operation is a priority. Features include an OLED display for real-time status monitoring and a web server on the Espressif ESP32 for remote control through network UPS tools.

What makes this UPS truly unique is its commitment to open hardware. Walker and Protectli have empowered users to modify and enhance the UPS according to their needs. The firmware for both the ESP32 and RP2040 microcontrollers is available for user modifications, fostering a collaborative environment for innovation.

For those eager to delve into technical details, schematics and source code are accessible on GitHub under the MIT licence. This transparent approach encourages modification and promotes a sense of community-driven development.

Protectli plans to expand the reach of this innovative UPS, with details and updates on the commercial release available on their website.

Resolvr to use open source tools for justice

The Resolvr Project is ushering in a new era of justice with its Open Source Justice initiative. Focused on implementing open source dispute resolution tools on protocols like Nostr and Bitcoin, it aims to liberate communities from the constraints of traditional legal systems.

State-run courts, akin to the flaws in the fiat currency system, have been plagued with issues. Over 4 billion people lack access to justice, and even in developed nations like the United States, a significant justice gap exists. Resolvr identifies the need for private, accessible, and affordable alternatives.

By deploying conventional alternative dispute resolution (ADR) and online dispute resolution (ODR) designs on open source protocols like Bitcoin, Nostr, and Fedimint, Resolvr breaks the link to state-run courts. Open Source Justice empowers

communities to peacefully resolve disputes using open source tools, championing fairness, transparency, and decentralisation in conflict resolution.

Resolvr’s inaugural product targets the Free and Open Source Software (FOSS) ecosystem with

a peer-to-peer bounty marketplace. Traditional bounty platforms suffer from trust issues, including exit scams and delayed payouts. Resolvr addresses these challenges by limiting discretion, crowdsourcing community reviews, utilising Nostr for interoperable bounty discovery, and employing Lightning zaps for instant payouts.
