

Figure 2: Image with an object

Figure 3: Masked image

**Calling pipe to generate an image:** Pass the above specified three parameters to the pipe. Finally, the generated image will be stored in `output_img.png`.

```
image=pipe(prompt=prompt, image=input_
image, mask_image=mask_image).images[0]
image.save("./output_img.png")
```

## Final thoughts

Generative AI is a powerful, revolutionary tool that can bring about enormous changes in how we live—giving our thoughts an image or a voice to be heard. Stable Diffusion is just a torch bearer in the field of generative AI.

While generative AI brings numerous advantages, such as enhancing content creation and improving workflow, it also creates disorder if used incorrectly, like the use of deep fakes to falsify legal evidence and impersonate individuals without their consent. But the bottom line remains that generative AI is an accelerating force reshaping various fields, from medicine to content creation, by expanding the limits of artificial intelligence. **END** 🐧
