

Resolvr enhances transparency by linking Nostr accounts to GitHub accounts, creating reputational stakes. Nostr zap polls (NIP-69) enable crowdsourced decisions on bounty disputes, a groundbreaking approach to dispute resolution. The integration with the Bitcoin Lightning Network ensures near-instant, peer-to-peer bounty payouts, reducing custodial risks.

Resolvr's roadmap includes a noncustodial, Bitcoin-native escrow system powered by discreet log contracts. Additionally, communities will be invited to serve as 'review associations', earning Bitcoin for resolving bounty disputes. Resolvr plans to revolutionise dispute resolution globally, offering cost-efficient mechanisms for various use cases.

Baidu releases Apollo Open Source Platform 9.0

Baidu's Apollo Open Source Platform 9.0 is tailored for developers and ecosystem partners, and cements the company's dominance in autonomous driving. The 9.0 version amps up algorithm capabilities, offers a more user-friendly toolkit, and widens its range of scenarios.

From engineering framework to universal scenarios, Apollo Open Source Platform has been breaking barriers since its inception. The 9.0 update splits modules into smaller packages for flexible assembly and introduces abundant components, plugins, and feature expansions.

Algorithms get a boost with optimised perception, integrating advanced models like CenterPoint for LiDAR detection and Yolo X + Yolo 3D for visual enhancements. Incremental training, supporting independent model training, boosts detection capabilities while keeping costs low. The toolkit gets an upgrade with new functionalities like high-precision mapping and sensor calibration.

The Dreamview+ debugging tool has been revamped, streamlining processes for developers. Documentation is overhauled for a smoother experience, reducing the learning curve.

Baidu claims the 9.0 version reduces adaptation stages by 40%, code reading by 90%, and debugging by 80%. It enables swift implementation of autonomous driving within a week and completes diverse scenarios within a month. Sensor calibration and map creation cycles are expedited to hourly levels.

Hardware compatibility gets a boost with support for configurations like 3 LiDAR plus 4 cameras and over four camera manufacturers.

Mozilla's Firefox 121 woos Linux users

Mozilla's latest release, Firefox 121, marks a turning point for Linux users, particularly those on the Wayland display server. The browser now defaults to Wayland mode for all Linux users, building on the success seen in Ubuntu 23.10. This shift promises enhanced graphics performance, resolving long-standing issues with non-blurry rendering on HiDPI displays, fractional scaling, and comprehensive support for touchpad and touchscreen gestures.

In the broader context, Firefox's move aligns with the undeniable trend of Wayland becoming the go-to for modern, secure, and high-performance display servers on Linux. This is a pivotal step towards the future, responding to the growing demand for advanced features like HDR support on Linux.

Vivaldi 6.5 comes with game-changing features

Vivaldi, the powerhouse web browser, has released version 6.5. Boasting enhanced functionalities and addressing user demands, this update brings a slew of exciting features.

At the forefront is the much-anticipated 'Sessions Panel'. Found in the sidebar, it lets users effortlessly save, edit, and sync sessions. The standout? An automatic backup option for the ultimate 'set and forget' convenience.

Workspaces get a productivity boost with new automation rules. Tabs can be easily managed by creating rules for specific sites, automating workspace organisation. A simple UI at *Settings > Tabs > Workspaces* makes this a breeze.

Syncing across devices gets a facelift, now offering access to the entire browsing history with end-to-end encryption. One can search through synced open tabs directly from the address bar, a time-saving change for those on the go.

'Notes' has received a usability upgrade, refining the note-taking experience. Syncing open tabs has become more intuitive, accessible directly from the address bar.

Vivaldi 6.5 can be downloaded on Linux, Windows, or macOS from the official Vivaldi page. Ubuntu users can opt for the .deb package via the Ubuntu Software app.

For existing users, the update arrives seamlessly through in-app updates for macOS and Windows, or through your Linux distro's package manager.
