

Nessus

- This remote security scanning tool scans and raises alerts if any vulnerabilities that malicious attackers could exploit are found.
- These include sensitive information, unauthorised control, misconfiguration, denial of service vulnerabilities, vulnerable passwords, and so on.

Metasploit

- Metasploit is an open source exploit framework, though it also has the enterprise edition for performing ethical hacking.
- It provides information on security vulnerabilities and allows customisation for penetration testing on networks and systems.

Sn1per

- This framework has been developed for penetration testing and evidence gathering.
- It saves time by automating the execution of open source or commercial tools and viewing the results in web reports.

TheHarvester

- This command-line tool acts as a search engine for the given domain and finds the list of email accounts, subdomain names, virtual hosts, open ports and employee details.
- It gathers this information from public sources.

fireELF

- Fileless attacks occur in the memory without writing into disks. fireELF is an open source fileless malware framework that injects fileless exploit payloads into a cross-platform host.

RouterSpoilt

- This open source exploit framework provides vulnerability scanners that are dedicated for embedded systems.
- It allows penetration testing operations such as:
 - *exploits*: Modules taking advantage of vulnerabilities
 - *creds*: Modules to test credentials
 - *scanners*: Modules to check if any vulnerability is found to exploit
 - *payloads*: Modules for generating payloads for various architecture and injection points
 - *generic*: Modules to perform general attacks

BeEF

- BeEF is the abbreviation of 'browser exploitation

framework' and is used for recovering web sessions and exploiting client side scripting, including mobile clients.

- This penetration testing tool focuses only on web browsers.

OWASP ZAP

- This is the most popular open source web application and mobile security scanner tool, used by both developers and penetration testers.

Pacu

- This open source comprehensive scanning and exploit tool has been developed exclusively for Amazon, for AWS penetration testing.

Cuckoo

- Cuckoo is an open source malware analysis tool, used to launch malware in a secure and isolated environment.
- Providing a file to the command *Cuckoo* returns the result of the complete impact when the file is executed in an isolated environment.

WinHex

- WinHex is a universal hexadecimal editor, particularly helpful in the realm of computer forensics, data recovery, low-level data processing, and IT security.
- An advanced tool for everyday and emergency use, it inspects and edits all kinds of files, and recovers deleted files or lost data from hard drives with corrupt file systems or from digital camera cards.

FTK Imager

- This data preview and imaging tool lets you quickly assess electronic evidence for further analysis.

Autopsy

- Autopsy is a digital forensics platform and graphical interface for digital forensics tools.
- It is used by the law enforcement, military, and corporate examiners to investigate what happened on a computer, and can recover photos from a camera's memory card.

Sniffer

- This tool allows users to 'sniff' or monitor their internet traffic in real time, capturing all the data flowing to and from their computer.
- By recording packets, they can trace connection states to the exact point at which these fail, which may help
