

in further detail to fully realise its infrastructure automation potential.

Further exploration opportunities

We have covered server configuration basics in this article, but nginx offers a lot more settings for users to make sure their server runs as smoothly and safely as possible. From load balancers to caching, SSL certificates, and more, you can check out these settings to make sure everything is running smoothly.

Terraform isn't just for nginx — you can use it to deploy other services too! From databases to cloud storage to virtual machines, Terraform can help you expand your knowledge and expertise in infrastructure automation. Try out

different cloud services and providers from Terraform. Find out how to make sure your infrastructure is secure and follow the best practices for controlling access and staying compliant. See how Terraform works in real-life situations.

By adopting Terraform, projects may be made more innovative and agile by effectively creating, managing, and scaling complex cloud architectures. The field of infrastructure

automation is still in its infancy. Becoming proficient with Terraform and understanding how it shapes the contemporary infrastructure scene can be highly rewarding. With the constant development of technology and the growing need for efficient and scalable infrastructures, learning and understanding Terraform is a must for any developer and system administrator. **END**

- to diagnose some types of problems that are otherwise difficult to detect.

Brutus

- Brutus is one of the most powerful, fastest, and flexible remote password cracking tools.
- This password cracker bangs against network services of remote systems, trying to guess passwords by using a dictionary and permutations thereof.
- It supports protocols like HTTP, POP3, FTP, SMB, TELNET, IMAP, and NNTP.

Cain and Abel

- Cain and Abel is a password recovery tool for Microsoft Windows, used to recover many kinds of passwords using methods such as network packet sniffing. It attempts to crack various password hashes by using methods such as dictionary attacks, brute force and cryptanalysis attacks.
- Cryptanalysis attacks are done via rainbow tables, which can be generated with the *winrtgen.exe* program provided with Cain and Abel.

John the Ripper

- John the Ripper is a password-cracking tool for UNIX-based systems.
- It is designed to test password strength and brute-force encrypted (hashed) passwords, as well as crack

passwords using dictionary attack methods.

- It takes text string samples from a word list using common dictionary words or common passwords, and also works with encrypted passwords.

THC Hydra

- THC Hydra is a parallelised network login cracker.
- It works by using different approaches to perform brute-force attacks in order to guess the right user name and password combination.

Powershell/Bash

- Powershell is for Windows and Bash is for Linux-based operating systems. These are used for task automation consisting of the execution of command-line tools.

Python

- Python is a useful programming language for cybersecurity professionals because it can perform a variety of cybersecurity functions, like malware analysis, penetration testing, and scanning. **END**
