

Sarvam AI releases Hindi AI model: OpenHathi-Hi-0.1

Sarvam AI, the Indian AI startup, has launched OpenHathi-Hi-0.1, a paradigm-shifting open source Hindi language model. Built on Meta AI's Llama 2-7B model, the company proudly claims parity with the esteemed GPT-3.5 for Indic languages.

The blog post details the model's development journey, highlighting the challenges in tokenisation due to the scarcity of Hindi training text. The team executed a two-phase strategy, significantly reducing costs and paving the way for future language models.

OpenHathi-Hi-0.1 underwent rigorous testing, proving its mettle across benchmarks like translation, toxicity classification, and text classification. The company has focused on the model's versatility and its potential to advance AI capabilities in the Indian context.

Sarvam AI's collaboration with AI4Bharat, leveraging the latter's language resources and benchmarks, underlines their commitment to innovation in Indian language AI. Co-founders Pratyush Kumar and Vivek Raghavan, drawing on their experience at AI4Bharat, stressed the strategic importance of this partnership.

The base model's availability on the Hugging Face platform enables developers to fine-tune it for specific use cases. Sarvam AI envisions building large language models using voice as a common interface, aiming to address the diverse demands of the Indian market.

Following a recent \$41 million Series A funding round led by Lightspeed Ventures, Sarvam AI is poised to release enterprise-grade models on its full-stack Generative AI platform. This move not only marks a milestone for the startup but also signals a significant step in fostering innovation and accessibility in Indian language AI.

The update doesn't neglect practicality. Users gain control over window position settings and can personalise the interface with icon-pack selection.

Installation simplicity remains intact; Pano can be sourced from the GNOME extensions website. Ubuntu users can opt for the Extensions Manager desktop app from Ubuntu repos or Flathub. Ubuntu users must install libgda and gsound packages to ensure Pano's seamless functionality.

Pano Clipboard Manager's update, now aligning with GNOME 45, reinforces its position as a reliable clipboard manager for GNOME desktop users, blending functionality with simplicity.

Meta and IBM form alliance for responsible AI

Tech giants Meta and IBM have united with over 50 companies, research groups, and academic institutions to launch the AI Alliance—a collective push towards “open, safe, responsible AI.” The diverse group includes industry giants like Intel, Oracle, and Sony, along with startups like HuggingFace and Cerebras, and academic powerhouses such as UC Berkeley and Cornell.

The AI Alliance seeks to promote open and transparent innovation, prioritising safety, diversity, and economic opportunities. The collaborative effort aims to develop benchmarks, evaluation standards, and tools to aid the creation of AI systems. Notably, the group is keen on contributing to the development of multilingual models that address societal challenges in areas like climate and education.

Dario Gil, IBM's director of research, emphasised the significance of the AI Alliance, stating, “What's at stake is nothing less than the future of AI.” He underscored the collective strength of the initial group, investing over £80 billion annually in research and development, with a staff exceeding 1 million. He also stressed on the importance of a vibrant, open ecosystem for a healthy AI industry. Meta's president for global affairs, Nick Clegg, concurred, stating, “We believe it's better when AI is developed openly—more people can access the benefits, build innovative products, and work on safety.”

IBM, a key player with a rich open source history through Red Hat, stands poised to shape the future landscape of AI development.
