Containers

Understanding Linux Containers

Linux containers are emerging as a powerful tool for application deployment, packaging, and distribution. They offer numerous benefits over traditional virtualisation techniques, such as improved resource utilisation, faster provisioning, and greater scalability. Containerisation also enables developers to create self-contained software packages that can be easily deployed in any environment, regardless of the underlying infrastructure. The Other Side of Docker

Docker's lesser-discussed aspects such as its complexities, performance nuances, security concerns, and environmental inconsistencies are the focus of this article. You will get a balanced perspective on when Docker shines and when alternative technologies might better suit your needs.

Deploying a Java-Based Application in Docker

This tutorial will help you create a simple application using Maven, install Docker on the Ubuntu operating system, create a JAR file using Jenkins, and finally, deploy a Javabased app.

Tools for Monitoring and Managing Containers

Containers are lightweight and portable, and can scale rapidly, making manual management and monitoring a challenge. Thankfully, a number of free and open source tools are available to do the job.

AI and Docker: A Powerful Partnership

Containerisation technologies are evolving continuously and make substantial use of AI today. The synergy between Docker, a leading containerisation platform, and artificial intelligence is poised to play a pivotal role in shaping the future of containerised AI applications.

Deploy a Cloud container Using Azure AI Cognitive Services

Let's explore the diverse range of Azure AI services, highlighting their capabilities and the potential they offer for developers, and also look at how to deploy a cloud container using these services.

Why and Where to Use Kubernetes

Kubernetes is an open source container orchestration platform that automates the deployment, scaling, and management of containerised applications. Its benefits are manifold.
