Dashboard > test > Configuration

Configure

- General
- Source Code Management**
- Build Triggers
- Build Environment
- Pre Steps
- Build
- Post Steps
- Build Settings
- Post-build Actions

Source Code Management

☐ None

☒ **File System**

Path ?
/home/test/Desktop/my-app

☐ Clear Workspace ?

☐ Copy Hidden Files/Folders ?

☐ Enable filtering

☐ Git ?

Build Triggers

☒ Build whenever a SNAPSHOT dependency is built ?

☐ Schedule build when some upstream has no successful builds ?

☐ Trigger builds remotely (e.g., from scripts) ?

Save **Apply**

Configure

- General
- Source Code Management
- Build Triggers
- Build Environment
- Pre Steps
- Build**
- Post Steps
- Build Settings
- Post-build Actions

Build

Root POM ?
pom.xml

Goals and options ?
package

Advanced ▾

Post Steps

☐ Run only if build succeeds

☐ Run only if build succeeds or is unstable

☒ **Run regardless of build result**

Should the post-build steps run only for successful builds, etc.

Save **Apply**

Figure 4: Build configuration

Install the required packages:

```
test@ubuntu:~/Desktop$ sudo apt-get
install ca-certificates curl gnupg
```

Now add Docker's official GPG key:

```
test@ubuntu:~/Desktop$ sudo mkdir -p /etc/
apt/keyrings
test@ubuntu:~/Desktop$ sudo install -m
0755 -d /etc/apt/keyrings
```

```
test@ubuntu:~/Desktop$ curl -fsSL https://
download.docker.com/linux/ubuntu/gpg |
sudo gpg --dearmor -o /etc/apt/keyrings/
docker.gpg
```

File '/etc/apt/keyrings/docker.gpg' exists. Overwrite? (y/N) y

```
test@ubuntu:~/Desktop$ sudo chmod a+r /
etc/apt/keyrings/docker.gpg
```

Set up the repository:

```
test@ubuntu:~/Desktop$ echo \
"deb [arch=$(dpkg --print-architecture)
signed-by=/etc/apt/keyrings/docker.gpg]
https://download.docker.com/linux/ubuntu \
$(. /etc/os-release && echo "$VERSION_
CODENAME") stable" | \
```

```
sudo tee /etc/apt/sources.list.d/docker.
list > /dev/null
```

```
test@ubuntu:~/Desktop$ sudo apt-get update
```

It is now time to install the latest version of Docker.

```
test@ubuntu:~/Desktop$ sudo apt-
get install docker-ce docker-ce-cli
containerd.io docker-buildx-plugin docker-
compose-plugin
```

Verify the Docker version:

```
test@ubuntu:~/Desktop$ sudo docker version
```

We have an application package ready along with Docker. In the next section, we will create a Docker image using Dockerfile.
