

Deploy a Cloud Container Using Azure AI Cognitive Services

Let's explore the diverse range of Azure AI services, highlighting their capabilities and the potential they offer for developers, and also look at how to deploy a cloud container using these services.

Artificial intelligence (AI) has emerged as a transformative force in the rapidly evolving landscape of technology, changing the way businesses operate and people interact with digital systems. Microsoft Azure, a leading cloud platform, has positioned itself at the forefront of this AI revolution with a suite of powerful and comprehensive AI services.

Industry use cases of Azure AI cognitive services

Azure cognitive services have been developed through a combination of Microsoft's extensive research and development efforts in the field of AI and machine learning, along with the incorporation of cutting-edge technologies and methodologies. These are a set of AI services and APIs that enable developers to build intelligent applications without having

to delve deeply into the intricacies of machine learning. These services are categorised into vision, speech, language, and decision APIs, and offer a wide array of functionalities.

Azure AI cognitive services have been implemented across different industries. The use cases range from customer engagement to process optimisation. Table 1

Table 1: Real-time projects using Azure AI cognitive services

Industry	Real-time projects	Azure AI services used
Healthcare	Smart patient assistance	Language understanding (LUIS), Chatbot
Manufacturing	Quality control	Custom vision, Anomaly detector
Finance	Fraud detection	Anomaly detector
Education	Intelligent tutoring systems	Language understanding (LUIS), Speech-to-text
Smart cities	Traffic monitoring and management	Computer vision
E-commerce	Visual search	Computer vision
Hospitality	Multilingual customer service bots	Translator text, Chatbot
Energy	Predictive maintenance	Anomaly detector
