Steps to deploy a cloud container using Azure AI services

To deploy a container image using

Azure cognitive services, we generally use Azure container instances (ACI).

Step 1. Set up an Azure cloud account: If you don't already have a subscription, then start with an Azure free access.

Step 2. Log in at the Azure multi-service account: Once you successfully sign up on the Azure AI services account, a starting dashboard of Azure AI services will be displayed as shown in Figure 2.
