

Figure 6: Container service is successfully deployed

will open, where the user can review and finally create the container instance as shown in Figure 4.

Step 5. Details and activity log of created container service: On the 'overview and activity log' tab as depicted in Figure 5, you can check the details such as 'resource group', 'data centre location', 'pricing tier', etc, for the created container.

Step 6. Deploy the container: Finally, save your changes, and the container is successfully deployed. A sample application deployed is shown in Figure 6.

Microsoft Azure AI services provide a comprehensive and accessible suite of tools that empower developers and businesses to infuse intelligence

into their applications. Whether it's understanding natural language, recognising images, building machine learning models, creating conversational bots, or implementing powerful search capabilities, these services offer a wide range of functionalities to drive

innovation and deliver enhanced user experiences. As the AI landscape continues to evolve, Azure remains a reliable and cutting-edge platform for those looking to harness the potential of artificial intelligence in their applications and services. **END** 🐧
