

Flux: Declaring infrastructure as code

Flux is another open source tool based on GitOps for container apps and infrastructure, allowing the management of Kubernetes resources and workload dependencies. It advances infrastructure as code, enabling developers to declare infrastructure state at the source in Git repositories. This ensures that the actual infrastructure matches the desired state. One significant advantage of using Flux is its continuous monitoring of the infrastructure, automatically reconciling any discrepancies and bringing in reusability with stability in the complex web of cloud applications. Flux demonstrates its power through a seamless process of bootstrapping Flux components on the cluster with monitoring to ensure changes in the source are updated onto the cluster through the reconciliation process.

There are amazing open source tools that serve great purposes across the spectrum of platform engineering. Establishing a reference architecture by layer with a notion of critical functionalities will ensure a robust internal developer platform is established, allowing for flexibility and extensibility in leveraging leading

CI/CD pipeline integration products like GitHub Actions, Argo, and Flux. Understanding the design pattern of the developer environment and embracing change with plug-and-play models will go a long way in enhancing developer productivity while improving the quality of work experiences, leading to improved retention of top talent! **END** 🐧
