

However, a few hitches have been noted. Blue Recorder currently lacks PipeWire support, restricting audio selection to PulseAudio. Under Wayland, region recording is temporarily disabled, and saving to WebM occasionally results in blank files. Despite these quirks, the overall functionality remains robust.

Version 0.2.0 is available on Flathub and the Canonical Snap Store. Notably, the Snap Store version is in the edge channel, requiring the use of the ‘--dev-mode’ flag for installation on Ubuntu.

Linux users can anticipate an improved screencasting experience with Blue Recorder’s latest update.

Musique music player revamped with Qt 6

The open source desktop music player, Musique, has introduced its first major update in almost three years. The latest version, Musique 1.12, showcases a refined look, thanks to a transition to Qt 6.

Developer Flavio Tordini explained the overhaul, stating, “This Musique update is the first Qt 6-based release. The main effort has been modernising the look of the app: a more flat and clean style, with rounded artist pics and a nicer toolbar.”

Musique, available on Windows, macOS, and Linux, maintains its essence as a straightforward music player. Users can point it to a folder of audio files, allowing easy browsing of albums, artists, and genres, along with search and play functionalities.

The most conspicuous change in Musique 1.12 lies in its flatter user interface. The update presents a seamless design, eliminating the separation between the toolbar and library areas. This gives it a very clean (almost libadwaita-esque) look. The non-native window controls are disappointing, though.

The player’s info view has been redesigned, centralising lyrics and introducing zoomable text, enhancing accessibility and customisation.

The move to Qt 6 enables Musique to adapt seamlessly to dark mode preferences across different operating systems.

For those eager to experience the revamped Musique, the latest version can be downloaded for Windows, macOS, or Linux from the project website. Tech-savvy users can explore the source code on the Musique GitHub page, while Ubuntu users are advised to download a DEB installer compatible with Ubuntu 23.04 or later due to libmpv version changes.

Pano Clipboard Manager now supports GNOME 45

Linux users embracing Pano Clipboard Manager are in for a functional treat as the GNOME Shell extension now seamlessly supports GNOME 45 and Ubuntu 23.10.

Pano v22 has introduced pivotal features to elevate user experience. Now, users have the flexibility to position Pano—top, left, right, or bottom—tailoring its appearance. Font customisation and a subtle wiggle animation on content updates contribute to the user-friendly interface.

Zoom unveils open source vulnerability impact scoring system

In a bold stride towards enhancing cybersecurity, Zoom has introduced the Vulnerability Impact Scoring System (VISS). This open source framework, honed over a year, brings a customisable interface and advanced algorithms to the table, prioritising vulnerabilities based on demonstrated exploitation rather than theoretical impact.

Zoom hasn’t kept VISS under wraps, testing it within their bug bounty program since March 2023. The outcomes are striking, with a surge in reports featuring critical vulnerabilities.

VISS scrutinises vulnerabilities across 13 aspects, focusing on platform, infrastructure, and data. Severity is distilled into a numerical score from 0 to 100. The ‘compensating controls’ metric allows users to specify security measures mitigating exploitation.

Yet, adoption poses questions. VISS, born from a commercial giant like Zoom, might face hurdles. Existing systems like SSSC and VPR linger, yet none dethrone the industry titan, CVSS. CVSS, despite being a staple, faces critiques for subjectivity and narrow scope. CVSS 4.0 responds to this, but the consensus is clear—CVSS alone shouldn’t dictate risk or vulnerability patching.

As VISS steps in, promising real-world impact assessment, the cyber landscape awaits change. Will organisations embrace VISS, altering the trajectory of vulnerability management, or cling to the familiarity of CVSS? Zoom’s VISS signals a potential game-changer, navigating the ever-evolving cybersecurity realm.
