

Make a Digital Clock on Your Android Mobile Device

Interested in building a custom digital clock on your mobile device? This short tutorial will make use of App Inventor to help you do just that.

App Inventor is used to develop Android applications that are compatible with both mobile phones and tablets. It is free and cloud-based. To begin your App Inventor journey, you need a Gmail account to log in to the server and store your files. For uploading and testing the applications, your mobile device and computer must be connected to the same Wi-Fi network. If you are using a laptop, consider using a bigger external monitor for the best development experience.

In this article, we will learn to make a digital clock for Android mobile devices. It will show the time, date and day, which you can custom format according to your preferences. I have chosen this topic as an ideal starting point to learn how to use App Inventor.

App Inventor uses a block-based, drag and drop approach for designing apps. It is fun, especially for youngsters and novice users. Ideally, it will be easier to use if the developers have prior experience with a programming language. However, this article is

aimed at beginners, who have no past experience with App Inventor.

Logging into the server

Open your preferred web browser and type 'MIT App Inventor Login' in the address bar. From the list of results, select 'MIT App Inventor Login'. Enter your email address and password, then click 'Login'.

You will be greeted with a welcome screen. Click on 'Continue' and then on the 'Close' button. This will take you to the screen as shown in Figure 1.
