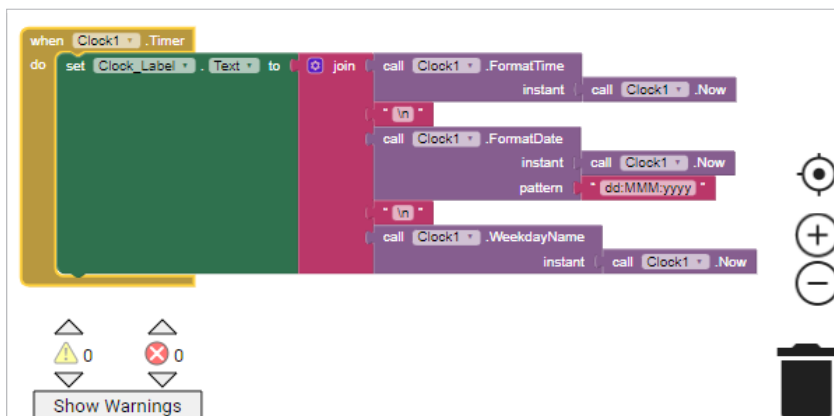

Figure 13: Adding weekday name

'Text' (in the *Blocks* pane) and drag the empty block (the topmost one) to link with the 'join' socket. In the empty block, type '\n'.

Next, incorporate the date string. For this we have to add more slots in the 'join' block. In this block, you can see a blue icon similar to that of *Settings*. Click on it and you will see the screen as shown in Figure 10.

On the right half of the new popped up window, you will see a 'join' block with two 'string' blocks already connected. Drag one of these 'string' blocks from the left half to the bottom of the 'join' block to ensure a proper connection. Repeat this step once more, resulting in two open sockets in the 'join' block as shown in Figure 11.

Go to *Blocks*, click on 'Clock1', drag 'call Clock1.FormatDate' block to attach to the 'join' block. Modify the pattern to dd:MMM:yyyy. Drag the 'call Clock1.Now' block to link with the 'instant' open socket as done before. Also connect the second open socket to the empty 'Text' block filled with '\n'.

Create another socket in the 'join' block to display the day. Introduce an additional open socket in the 'join' block. Drag 'call Clock1.WeekdayName' and connect it to the open socket. As before, pair the 'instant' with 'call Clock1.Now'. This concludes the programming side of the project.

Note the *Trash* bin at the bottom-right corner. You can use it to remove any unused elements. Simply drag these to the *Trash* bin and they will disappear.

It is now time to install the application on your mobile device. Go to the Play Store, download and install 'MIT AI2 Companion'. Go back to your browser and from the *Menu* bar select 'Connect'. From the resulting drop-down menu choose 'AI Companion'. This action will generate a QR code. Use your mobile to open 'MIT AI2 Companion' and scan the QR code. The app will be installed in the mobile, with a limited validity of only a few hours.
