

Virtana acquires OpsCruise, the cloud observability platform

To enhance its superiority in the IT operations management industry and make its foothold more robust in the AIOps and multi-cloud hybrid infrastructure software market, Virtana has acquired OpsCruise, a cloud observability platform.

OpsCruise's solution offers ITOps, DevOps, and SRE teams the opportunity to detect and diagnose the cause of any performance-related hiccups. It uses a profound comprehension of Kubernetes and contemporary applications along with its AI/ML-backed behavioural profiling.

This acquisition gives Virtana a jumpstart to its ambition of providing simplified and integrated hybrid infrastructure monitoring. Its coverage is now broadened to encompass open source, containers, cloud-native, and serverless applications in addition to on-premises, cloud, and edge multi-vendor settings.

OpsCruise was launched in 2018 as a partnership between The Fabric, a startup foundry focused on cloud and IoT infrastructure, and three technology entrepreneurs: Scott Fulton, Aloke Guha, and Shridhar Venkatraman. It had set out to counter the complexity and expense involved in overseeing applications in the cloud.

In 2020, Gartner certified OpsCruise's ability to solve problems for IT Ops and SRE teams by discovering performance issues quickly in Kubernetes and serverless cloud-native settings..

Virtana's existing platform, which offers unified hybrid infrastructure management services, will now benefit from OpsCruise's addition, including anomaly detection.

Kash Shaikh, president and CEO of Virtana, said, "The integration of OpsCruise into our portfolio was driven by our many conversations with IT leaders worldwide to understand their challenges and how Virtana can come address them."

Intel introduces One Mono Font to reduce eye strain

In a move to aid developers in combating the common issues of low vision and visual impairments, tech giant Intel has joined forces with type design company

intel/intel-one-mono

Intel One Mono font repository

intel.

Frere-Jones Type and global marketing agency VMLYandR to release a revolutionary new monospaced font collection: Intel One Mono.

This comprehensive language-supportive font set has been crafted with readability and clarity in mind, with the intent of relieving eyestrain and minimising coding errors.

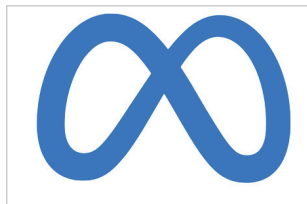

All users of the Intel One Mono font collection can enjoy free access, under an open source font licence, to the font's four available weights (light, regular, medium, and bold), each of which comes with accompanying italics for further versatility. And the list of over 200 supported languages, with scripts that include Latin, provides users with access to fonts that suit any application.

Intel One Mono is specially optimised to promote legibility and clarity. The font set includes special options like raised colon, language support, superior/superscript and inferior/subscript figures, and fraction numerals, which can all be accessed through CSS.

Developer fonts play a crucial role in enhancing the coding experience. Many integrated development environments (IDEs) and developer tools come with subpar fonts that can lead to eye strain and poor readability. Intel One Mono offers relief from eye strain and fatigue, allowing developers to do their best work. It is designed to help developers avoid headaches, improve code scanning, and bolster productivity.

Meta's 100% free LLM set to revolutionise AI

In a bold move that could reshape the AI industry, Meta plans to make its upcoming Large Language Model (LLM) open source and 100% free. According to *The Information*, Meta is shaking up the AI landscape by competing with

established industry powerhouses such as Google and OpenAI, who favour a proprietary model approach for AI solutions.

By creating a commercially licensed open source LLM, Meta has ushered in a new era of cost-effectiveness and adaptability in AI. This will be especially attractive for businesses that

want to take advantage of AI's power without an extravagant financial outlay. But Meta isn't the only one who stands to benefit. By making its code open source, the company has effectively invited developers all over the world to get involved in its AI environment, and can leverage their collective knowledge and experience to Meta's advantage.

One need look no further than open source platforms like Linux and WordPress to appreciate the value of this approach. Applied to AI, it has the potential to revolutionise development and capabilities for users—a true win-win situation. This was demonstrated with Meta's LLaMA model, which was initially limited to a select user base for research purposes, but eventually proliferated throughout the tech world and led to a flurry of new open source AI models.

In stark contrast to the methods employed by Google and OpenAI, Meta has placed a huge emphasis on transparency, regularly releasing research and code to the public. With the introduction of its free LLM, Meta has ushered in an opportunity to reshape the industry.
