

On the integration and management front, the platform brings forth improved monitoring and administration features. It enables real-time messaging and data streaming through Apache Kafka integration and introduces the OpenEdge Command Center (OECC) for simplified application management. The update also addresses database maintenance, allowing more tasks to be performed online, thus minimising downtime.

Security receives a substantial boost in the platform, with the introduction of Dynamic Data Masking (DDM) for data privacy compliance, Hardware Security Module (HSM) support for enhanced cryptographic security, and Transport Layer Security (TLS) 1.3 for improved encryption protocols.

The platform is a premier choice for developing enterprise applications requiring high performance and reliability across various industries, including healthcare, financial services, and manufacturing. The application development platform is now available, offering a comprehensive solution for modern business application needs.

Silicon Labs and Arduino partner to accelerate IoT development

Silicon Labs has announced a strategic partnership with Arduino. This collaboration aims to empower Arduino's vast community of 33 million developers by facilitating the seamless development of Matter over Thread applications, marking a significant milestone in IoT (Internet of Things) innovation.

For the first time, Arduino will offer Matter software libraries, developed in collaboration with Silicon Labs. These libraries are now available on the xG24 Explorer Kit from Silicon Labs and the SparkFun Thing Plus Matter – MGM240P development board, which is based on the xG24. Rob Shane, vice president of mass market sales and applications at Silicon Labs, highlighted the synergy between the

two companies, noting that this collaboration combines the ease of use and the powerful development environment of Arduino with the advanced security, energy efficiency, and processing power of Silicon Labs-based hardware.

The collaboration also unveils a treasure trove of resources for developers,

including code samples, reference designs, and documentation, all accessible on the Arduino Core for Silicon Labs Devices GitHub page. This initiative is poised to accelerate Matter development for Silicon Labs developers, lowering the barriers to entry and making it easier than ever to create Matter devices. Arduino's ecosystem, known for its hardware products, software solutions, and cloud services, thrives on its open source nature and the active participation of its community. Fabio Violante, CEO of Arduino, expressed enthusiasm about the partnership, emphasising its role in democratising Matter application development and fostering innovation in the IoT landscape.

The partnership aligns with Silicon Labs' goal of simplifying IoT development, highlighting the company's commitment to evolving its development tools.

OpenAI to invest in Indian developers

OpenAI, the parent of ChatGPT, is making strategic moves to deepen its engagement with the developer community in India. Jason Kwon, the chief strategy officer of OpenAI, announced at the *Economic Times Now Global Business Summit* in New Delhi that the company plans to host several developer summits across India throughout the year.

Kwon highlighted India's potential to be a global leader in AI, citing the country's history of technological innovation and ambition to compete internationally. OpenAI is looking to collaborate with Indian developers and product leaders to address complex challenges in AI development. The company recognises the significance of the Indian market, as India has the second-highest number of ChatGPT users, accounting for 9.08 per cent of the tool's over 180 million global users.

OpenAI's engagement in India began earlier this year when Srinivas Narayanan, vice president of engineering at OpenAI, interacted with developers in Bengaluru in January this year. Kwon also emphasised the importance of safety in AI research and development. OpenAI is investing in technologies and forming partnerships to enhance the safety of its AI tools and is working with governments to develop regulatory frameworks.

To navigate India's evolving AI policy landscape, OpenAI appointed Rishi Jaitly, a former vice president at X, as a senior advisor last year. Jaitly's extensive executive experience will provide valuable guidance to OpenAI as it expands its presence in the Indian AI ecosystem.
