

based on technologies like Hyperledger Fabric and Chaincode, is freely available to them. They can easily integrate and start operating their node.

Q. Would this have been possible in the absence of open source?

A. No, our platform's current development wouldn't be possible without open source. Technologies like Hyperledger, crucial to our platform, stem from the open source movement. Hyperledger, created by the Linux Foundation with contributions from entities like IBM, is a key example. Open source is vital — the collaborative model allows extensive input from a diverse community, which is impossible with proprietary software, especially for small entities. IBM's decision to open source such technology has facilitated widespread adoption and further development.

Q. Why choose Hyperledger Fabric for handling personal and confidential data?

A. This decision prioritises privacy and control due to the sensitivity of personal information. Public blockchains, like Ethereum, lack the necessary privacy controls. The data on a public blockchain is visible to all with network access, undesirable when handling personal data. Hyperledger Fabric, on the other hand, enables the creation of a private, permissioned blockchain. Only a consortium of vetted, Digital Personal Data Protection (DPDP) Act-compliant companies can access and manage the data, ensuring secure and non-public exposure.

Q. What do you mean by a node?

A. In our context, a node, like Rezoomex, is a blockchain operator with identical functions. Each node operates a copy of the blockchain, consisting of blocks containing resumes, transactions, and smart contracts. All nodes must agree and validate information for a

block to be added, confirming legitimacy and ownership, including NFT minting. Once all nodes verify a block, it becomes verified in the blockchain. Unlike centralised systems, our decentralised blockchain distributes data ownership among multiple nodes instead of a single entity. Nodes collaborate to maintain data integrity and verification in the blockchain.

Q. How is sensitive public data secured when it is open sourced? What measures are put in place?

A. The government of India has implemented the Digital Personal Data Protection Act, which our platform fully complies with. This act defines 'digital personal data' as sensitive information, including an individual's name and identity. Personal data, as defined by the DPDP Act, cannot be disclosed without explicit permission and only for the specific purposes granted. On our platform, privacy is prioritised by using avatars instead of revealing names. While users can access information about skills and experience, actual identities remain concealed. Personal data is not disclosed, and information sharing is solely for obtaining gig work. Unlike platforms that share user data for marketing, our approach ensures private identities and contacts. If a party wants a user's identity, they must request it, and disclosure happens only after user permission.

Q. As there is no cash inflow from the users, how is money being generated on the Rezoomex platform?

A. The revenue generation on our platform is primarily through transaction fees. When two parties engage in a transaction for gig work on the platform, we collect a fee from this transaction. This fee is the primary source of our income. Rezoomex earns revenue by charging a transaction fee, similar to how credit card companies operate. For every gig work transaction facilitated

through our platform, we collect a fee of 2.5%. The platform operates based on information exchange between two interested parties: one side being the gig worker offering their services, and the other being the entity that requires and pays for these services. Neither side is required to make any investment or payment to use the platform itself; the platform's services are free for both parties involved in the gig work.

Q. Is there a fee for building an account on Rezoomex?

A. Creating an account on Rezoomex does not involve any upfront fees. Users are only required to pay when a smart contract they are involved in is successfully executed and completed. This payment occurs at the final stage of the process, where a task or work assigned is completed. The payment is made to the NFT holder who has finished the task, not directly to Rezoomex.

Q. What benefit does Rezoomex get by collecting resumes at Open Source India?

A. At Open Source India, we are using the opportunity to educate people about concepts like NFTs (non-fungible tokens), avatars, and smart contracts, which are integral to our platform. By engaging attendees in the process of minting their NFTs and creating avatars using their resumes, we provide a hands-on learning experience. This practical involvement goes beyond just reading a brochure, as participants actively go through the steps of using our platform. The booth at Open Source India attracted a significant crowd, indicating the interest and engagement of the participants. Even after we ran out of swags, people continued to visit our booth for the experience and learning.

Q. Is the interaction between a gig worker and the one handing out the contract direct, or does it happen through a channel?

A. The interaction occurs through our platform, acting as an intermediary
