

Table 3: Comparison of AI-based literature mapping tools

Tools	Developed by	Literature searching	Integration with referencing software	Cost
Research Rabbit	Research Rabbit Ltd	By similarity and citation count	Sync with Zotero and import/export RIS and BibTex files	Free
Inciteful	OpenAI	By similarity and citation count	Import/export files from BibTex/Zotero	Free
Litmaps	Kyle Webster and Axton Pitt	By similarity, citation count, and AI semantic search	Sync with Zotero and import/export RIS and BibTex files	Premium
Connected Papers	Connected Papers	By similarity and citation count	Export files in BibTex	Premium

and keep pace with advancements in AI and natural language processing technologies.

ChatGPT alternatives, such as Perplexity, Scite, Elicit, Consensus, Microsoft Bing, Poe, and ChatSonic, have emerged as valuable tools in the research landscape. These alternatives offer a range of applications tailored to the specific needs of researchers, including language model evaluation, academic paper analysis, text extraction and summarisation, consensus analysis, web search and information retrieval, creative writing generation,

and conversational AI for research assistance. Figure 3 shows the tools that are alternatives to ChatGPT.

To sum up, ChatGPT-based tools are valuable assets for researchers seeking to optimise their research workflows and achieve greater efficiency and impact in their academic endeavours. By automating tasks such as literature

review, statistical analysis, and paper writing assistance, these tools enable researchers to focus more on their work's creative and analytical aspects. **END**

The author is a B. Tech, M. Tech, and PhD in CSE. He works as assistant professor in the School of Computer Science Engineering and Technology at Bennett University, Greater Noida. He is experienced in cloud computing and open source technology.

Continued from page... 27

Data integration: When you want to create comprehensive reports, you bring together data from various sources. Just as in cooking, you combine different ingredients to make a mouth-watering dish.

Data cleaning: Data management involves cleaning, much like washing and preparing ingredients before cooking. It's about ensuring that the data you use is of top quality.

Data security: This is your security setup. You install locks on the doors and windows of your business, ensuring that only authorised personnel can access your data.

Data governance framework:

You create the kitchen rules. This framework includes policies, roles, and responsibilities to manage data consistently and responsibly.

Master data management (MDM): Certain data, like your best-selling product details, needs to be consistent

across the board. MDM is like making sure all your chefs follow the same recipe to cook a signature dish perfectly every time.

Data backup and recovery: This is your disaster recovery plan. It's like having a backup generator in case of a power outage. You ensure that if something goes wrong, you can quickly recover your data and get back to business.

Data analytics and reporting: Now, it's time to whip up some delicious insights. You use data analysis tools and reports to understand your customers' preferences, forecast

demand, and make informed decisions. It's like creating a menu based on customer feedback and sales trends.

In the end, data management is a lot like running a successful restaurant. It involves gathering quality ingredients (data), having a well-organised kitchen (data architecture), following recipes (data governance), ensuring food safety (data security), and offering a delightful menu (data analytics). Just as a chef uses culinary skills to create a delightful dining experience, data management professionals use their expertise to maximise the potential of data, turning it into an asset for your business. **END**
