

Boot from the USB drive or CD/DVD: Insert the bootable media into your system and restart. Enter the BIOS or UEFI settings to select the boot device as your USB drive or CD/DVD.

Follow the Debian installer prompts:

- Select the installation language as English, location as 'India', and keyboard layout as 'American English'.
- Configure the network to gain internet access and set the host name, for example, *gpt.deepen.in*.
- Set up users and passwords. Create a root password and a new user (sysadmin) with a new password.
- For disk partitioning, select 'Guided - use the entire disk' and choose 'All files in one partition' as the partitioning scheme for simplicity.
- Confirm to 'Finish partitioning and write changes to disk' and select 'Yes' to write changes.
- Choose 'No' when asked to scan another installation media.
- Configure the package manager, select 'India' for Debian repositories, and proceed with the default archive mirror.
- Opt out of the package usage survey by selecting 'No'.
- In the software selection screen, ensure only 'SSH server' and 'Standard System Utilities' are selected for installation.
- Install the GRUB bootloader on the primary drive (e.g., */dev/sda*) when prompted.

Complete the installation and

reboot: Allow the installer to finish the setup. Once completed, remove the installation media and reboot into your new Debian system.

Post the installation, follow these steps.

After rebooting, log in as root to your system and install the necessary packages to proceed with the setup of your offline AI tool. Begin with installing Git, which is essential for downloading the GitHub repository in the next steps:

```
apt -y install git
```

This completes the environment setup required for installing your offline, on-prem ChatGPT tool. With your Debian system ready, you are now set to proceed with the installation process of Ollama and Ollama-WebUI.

Installation process

The core of setting up your offline, on-prem ChatGPT tool involves downloading the necessary software, setting up the main engine, integrating AI models, and finalising the web interface.

Downloading the GitHub

repository: First, you will need to clone the repository containing all the scripts and configurations required for the setup. Open a terminal on your Debian system as user root and run the following command:

```
git clone https://github.com/
deependhulla/gpt-debian12 /opt/gpt-
debian12
```

This command clones the repository into */opt/gpt-debian12*, a directory that will serve as the working directory for the installation process.

Changing to the installation

directory: After cloning the repository, change your current directory to */opt/gpt-debian12* to access the setup scripts:

```
cd /opt/gpt-debian12
```

Running setup scripts: The installation process is divided into four main scripts, each responsible for a different part of the setup. Execute these scripts in the order listed below to ensure a successful setup. These scripts will install the necessary packages, set up the Ollama main engine, download AI models, and configure the Ollama-WebUI.

1. **Basic package setup:** This script installs the basic packages and modules required for the Ollama engine and web interface.

```
./01-basic-package-setup.sh
```

2. **Ollama main engine setup:** This sets up the Ollama main engine, ensuring that the core functionalities are properly installed and configured.

```
./02-Ollama-main-engine.sh
```

3. **Downloads of Ollama models:** This script downloads the necessary AI models for Ollama. These models are crucial for enabling AI's generative capabilities.

```
./03-Ollama-models-downloads.sh
```

4. **Ollama WebUI setup:** The final script sets up the web interface, making it easier to interact with the Ollama engine through a browser.

```
./04-Ollama-WebUI-setup.sh
```

After running all the scripts, it is important to verify that each component of the Ollama setup has been installed and configured correctly. Check the output of each script for any errors and ensure that all processes are running as expected.

This completes the installation process of your offline, on-prem ChatGPT tool. With Ollama and Ollama-WebUI now set up, you are ready to access the web tool and start exploring its capabilities.

Accessing the web tool via browser

To access the Ollama WebUI, open a web browser and navigate to *http://<IP_ADDRESS>:8080/*, replacing *<IP_ADDRESS>* with the actual IP address of the server where you installed Ollama. Upon accessing the WebUI for the first time, the initial account to sign up is automatically granted administrator privileges. This account has comprehensive control over the platform, including user management
