

You can either specify the language using the language argument, or you can provide Whisper with the audio file directly, and it will detect the language automatically, using the first few seconds of the audio file and provide you with the transcription.

You can also obtain the English translation using the command given below. You can use the `–translate` parameter for this purpose as an argument and, as you can see, you get the perfect translation.

```
[(base) Jishnus-MacBook-Air: downloads jishnusaurav$ whisper
audio_sample_hindi.wav --language Hindi --task translate ]
/Users/jishnusaurav/anaconda3/lib/python3.11/site-packages/
whisper/transcribe.py:126: UserWarning: FP16 is not suppo
rted on CPU; using FP32 instead
warnings.warn("FP16 is not supported on CPU; using FP32
instead")
[00:00.000 --> 00:05.000] My name is Jishnu and I am a very
good person.
(base) Jishnus-MacBook-Air: downloads jishnusaurav$
```

We can also run Whisper using Python code. In case you want to run it on a larger number of files, the basic code is shown below. This code can be further updated to be used for batch processing, etc.

```
import whisper

model = whisper.load_model("base")
result = model.transcribe("audio_sample.wav")
print(result["text"])
```

That was it! You have now successfully used the OpenAI Whisper model to perform speech-to-text transcription. There are numerous uses of speech-to-text, from improving customer service to obtaining official transcripts. You have taken your first step towards automating such processes. You can use this as a foundation and learn more from the official documentation to build more applications and use cases for Whisper. The Whisper official website and Git repository are shared below.
