

Figure 2: Benefits of multi-cloud architecture with distributed workflow leveraging open source

- actively maintained tools
- **Build a strong community:** Actively engage with open source communities for support and collaboration
- **Prioritise security and governance:** Implement robust security policies and compliance measures across clouds
- **Plan for automation:** Automate deployments, scaling, and operations for efficiency and reliability

In a nutshell, multi-cloud architecture with distributed workloads is employed for various reasons including mitigation of vendor lock-in concerns. Organisations do so as they weigh in benefits such as improved reliability, scalability, and cost optimisations, which outweigh the concerns. Distributed workflow, especially of AI across different cloud platforms, provides significant workload management benefits enabling the true strengths of each cloud

service provider's native services to be leveraged for an optimised performance.

Figure 2 indicates the positive effects of proper multi-cloud architecture that has distributed workloads across different cloud service providers with the use of open source tools. This helps unleash the true power of AI at a lower cost as compared to

proprietary platforms.

Managing multi-cloud deployments for AI unlocks tremendous potential. With the right open source tools and best practices, you can navigate the complexity, avoid vendor lock-in, and achieve true agility and cost-effectiveness. Embrace the multi-cloud multiverse with open source tools and empower your AI journey! **END** 🐧
