

and mobile apps can actively involve patients in their treatment. Consequently, patients are more likely to participate in their care and report higher satisfaction with their healthcare professionals.

Cost savings and operational efficiency: IoT and telehealth have

demonstrated their cost-effectiveness for both patients and healthcare systems. A report by Deloitte estimates that IoT in healthcare has the potential to annually save the industry up to \$300 billion through remote patient monitoring, preventive care, and improved medication adherence.

Telemedicine and telehealth services: Telemedicine and IoT infrastructure extend healthcare accessibility to remote or underdeveloped areas. Telehealth services also reduce the necessity for in-person visits, improving overall access to healthcare.
