

Figure 2: Future land management process

Transparent registration process:

Automating the process of registration using smart contracts does away with mediators who are vulnerable to corrupt practices.

Benefits of blockchain technology in land management system

One of the major benefits of using blockchain is the reduction in the cost of storing physical records of any land property. Other benefits are:

- Greater transparency, as transaction histories become more transparent using blockchain technology
- No need for trusted authorities like notaries to provide attested copies of documents
- Citizens are assured that their land ownership cannot be changed by spurious persons
- Enhanced security – blockchain is far more secure than other record-keeping systems
- Elimination of error-handling through real-time tracking of transactions with no double spending
- Improved traceability

- Trusted recordkeeping
- Purchaser need not depend on any unreliable personnel/agency to verify the authenticity of the document provided by the seller
- Increased efficiency and speed, reducing settlement time to mere seconds by removing intermediaries
- Reduced cost and complexity due to the elimination of expensive proprietary infrastructure
- Full automation of transactional processes, from payment through settlement

Blockchain-based government applications prevent illegal activities involved in land transactions. All contracts and ownership details are maintained in a decentralised way, eliminating the need for physical intervention. Data transactions can be tracked easily, which improves the overall security of the system.

Blockchain is a unique and universal technology that helps streamline and automate nearly all citizen services and legal contracts, while increasing the transparency and effectiveness of government services. **END** 🐧
