

whole landscape can change and become more accessible to consumers as well as content creators.

Advertising: Advertisers can use blockchain to place their ads and earn revenue in millions of dollars. With blockchain-powered browsers, it is now possible for consumers to turn off the advertising and protect their privacy at the same time.

Market evaluation/forecasting: Blockchain can speed up market forecasting to an entirely new level, as it can hold a massive amount of data that can be used in conjunction with machine learning or artificial intelligence.

Crime management

Blockchain can help enforce the law and ensure that crime remains at an all-time low.

- **Police/law:** The blockchain maintains integrity of data and helps in storing all the evidence. In addition, it is distributed without worrying about tampering. It adds the necessary layer of security that adds trust to law enforcement.
- **Gun tracking:** With blockchain, we can have a system where each gun can be accounted for. Each weapon that leaves the factory can be tracked to help stop illegal gun usage and export. Once stored, the information can be retraced whenever needed. A gun used in a crime can be traced back to its original owner or its origins can be known instantly.

Transportation

The transportation industry can be transformed by blockchain adoption. It lowers processing and administrative costs, minimises disputes, improves overall transportation speed, and much more.

- **Business transportation:** Blockchain allows easy data coordination using DLT. Smart contracts can be used to automate most of the transportation pipeline, or to create a custom solution to enable transportation for fragile and sensitive products easily. The whole network can scale to include more transportation vehicles, products, and information.
- **Automotive:** With self-driving cars already out and shipping, it is now high time for the automotive industry to make use of the blockchain. The revolution has already started. The IOTA (Internet of Things Application) blockchain has already shown a proof-of-concept for how its Tangle DLT can work for autonomous cars.
- **Public transport:** Public transportation always demands improvement. With blockchain, things can change drastically.

Fintech

Right now, tons of fintech start-ups are working to provide a better solution by using blockchain.

Blockchain is the greatest disrupter to the global financial services system of this generation. Banking systems and principles, underlying banking transactions, and bookkeeping

are complex and challenging. With a blockchain-based solution in place, complex processes that once took weeks to reconcile can be completed in a few minutes.

Existing ledger accounting in the financial services sector is usually in the form of a centralised and private database, not too different from the paper based versions used a long time back. With blockchain, the ledger moves to an open and distributed record shared across the participant nodes in the blockchain. Each node maintains its own version of the ledger, and the network must collectively agree on the authenticity and correctness of transactions before carrying out an update.

Contracts

Contracts help to set up requirements for taking up a job, for payment and any other tasks that require two parties. They can be related to music, land, property, etc.

- **Inheritances:** Smart contracts empower digital inheritance, which means to transfer digital assets to someone.
- **Legal contracts:** Legal contracts can take advantage of smart contracts. However, they must adhere to the blockchain law.
- **Property and land:** Blockchain can provide a suitable means to register deeds, property ownership, and so on. This will remove any frauds, and any change of deed is brought to the notice of the owner. In addition, the information can be backtracked with full transparency and security.

Supply chain management

In supply chain, blockchain technology can be used to store and record all the transactions and exchanges of ownership, right from the extraction of raw materials to delivery to the customer. It helps to identify where the materials were sourced, the type of labour used, and the exact position of the goods at any given moment.

In supply chain management, blockchain technology enables enterprises to:

- Verify materials
- Identify asset quantity as the assets move through the supply chain
- Coordinate orders and shipment notifications
- Verify the constitution of materials
- Increase scalability, security, and innovation
- Link physical materials to serial numbers, bar codes, and digital tags
- Share important information about the manufacturing process, assembly, delivery, and vendors

Entertainment

Blockchain is also changing the entertainment industry in several ways.

- **Entertainment industry:** The future of entertainment is in the hands of the blockchain. Blockchain will change how content is created and consumed.
