friend from services like WhatsApp. You can just open WhatsApp in Halo Mode, and reply to your friend without leaving your previous work.

Note: XHaloFloatingWindow may conflict with OmniROM's multi-Window, but it was working fine with Xposed XmultiWindow module (which is a port of the split view feature of OmniROM, available through Xposed), which we will discuss later in this article. Also while testing this app, the *Long Press Recent Apps* option was not working properly.

XmultiWindow

This module ports OmniROM's split view to other ROMs. As per information available, it works on MIUI and stock ROMs, and it worked fine with my stock ROM too. Again, download and activate the module and reboot the device. While you have instructions to follow, I found them confusing, so this is how I went about things. Open the app and tap on *Open SideBar*. After tapping on the option, go to the home screen and wait for the split view to appear; if it doesn't appear implicitly, invoke it by swiping the left edge of the screen towards the centre and you will notice a left side launcher like Ubuntu's Unity launcher. If it doesn't appear, keep trying with different gestures on the left edge of the screen. Now to open any app in split view, click on that app from the left-half of the split menu and select the workspace in which you want to place the apps. After selecting two apps each in

different workspaces, your screen will look something like this.(mention fig no...is it Fig 8?) To hide the left bar, just click on the notification of XmultiWindow from the Status Bar.

App settings

This module allows you to tweak settings for an individual app. Here's the list of settings that you can change for an app.

- DPI and reported screen size
- Font scale
- Locale
- Full screen mode, plus immersive mode on KitKat
- Hiding the title bar

For complete check the app on Xposed Repo. Now, let's try this on an app, which in my case is Adblock Plus. Install, activate the module and reboot the device. Open the app and you will see a list of apps installed on your system. Then, click on the app for which you want to change settings, which in my case is Adblock Plus. Toggle the settings *ON*, select your filters and after that, save this. If you want the original settings, just toggle settings to *OFF*. The result is shown in Figure 9.

MinMinGuard

Today, ads have become a necessary evil. So while you should not block ads from honest and hard working developers, sometimes they mess up the user experience. Before using the app, read its disclaimer, which can be
