

Now let's try installing a module.

Note: Ensure that you are in the relevant Perl directory while installing modules.

In the example below, you will `cd` to the directory where the 64-bit Perl version 5.16 is installed, execute the *portable.bat* file and install the *Net::SSH2* module. *Net::SSH2* is a great module that you can use to write Perl scripts to log in to Linux/UNIX servers (or any device based on these operating systems), run commands and capture the outputs.

```
C:\>cd C:\my64bitperl516
C:\my64bitperl516>portableshell.bat
-----
Welcome to Strawberry Perl Portable Edition!
* URL - http://www.strawberryperl.com/
* see README.portable.TXT for more info
-----
Perl executable: C:\my64bitperl516\perl\bin\perl.exe
Perl version : 5.16.3 / MSWin32-x64-multi-thread
C:\my64bitperl516>perl --version | find /I "version"
This is perl 5, version 16, subversion 3 (v5.16.3) built for
MSWin32-x64-multi-thread
C:\my64bitperl516>cpam Net::SSH2
--> Working on Net::SSH2
Fetching http://www.cpan.org/authors/id/R/RK/RKITOVER/Net-
SSH2-0.53.tar.gz ... OK
Configuring Net-SSH2-0.53 ... OK
Building and testing Net-SSH2-0.53 ... OK
Successfully installed Net-SSH2-0.53 (upgraded from 0.48)
1 distribution installed
```

Cd to the *my32bitperl518* directory, run *portablesell.bat* and you will have the 32-bit Perl version 5.18 running!

```
C:\Users\pmu>cd C:\my32bitperl518
C:\my32bitperl518>portablesell.bat
-----
Welcome to Strawberry Perl Portable Edition!
* URL - http://www.strawberryperl.com/
* see README.portable.TXT for more info
-----
Perl executable: C:\my32bitperl518\perl\bin\perl.exe
Perl version : 5.18.2 / MSWin32-x86-multi-thread-64int
C:\my32bitperl518>perl --version | find /I "version"
This is perl 5, version 18, subversion 2 (v5.18.2) built for
MSWin32-x86-multi-thread-64int
C:\my32bitperl518>cpam Net::SSH2
```

```
--> Working on Net::SSH2
Fetching http://www.cpan.org/authors/id/R/RK/RKITOVER/Net-
SSH2-0.53.tar.gz ... OK
Configuring Net-SSH2-0.53 ... OK
Building and testing Net-SSH2-0.53 ... OK
Successfully installed Net-SSH2-0.53 (upgraded from 0.48)
1 distribution installed
```

Note that it's installed the module again. It's because we were in the directory in which the 32-bit Perl version 5.18 is installed, that it went ahead and installed the module. The advantage is that we can selectively install modules for different versions of portable Perl! Note that in both the cases, it upgraded a pre-installed module of *Net::SSH2*. This is another advantage of Strawberry Perl. A lot of modules come pre-installed.

Check the outputs below. The first output shows that the module *Net::SSH2* is not installed for the ActiveState Perl.

```
C:\Users\pmu>perl --version | findstr /I "version active"
This is perl 5, version 16, subversion 3 (v5.16.3) built for
MSWin32-x64-multi-threadBinary build 1663 [296746] provided
by ActiveState http://www.ActiveState.com
C:\Users\pmu>perl doc perllocal | find /I "Net::SSH2"
C:\Users\pmu>
```

The same is true for Perl version 5.10:

```
C:\Users\pmu>C:\myperl510\portablesell.bat
-----
Welcome to Strawberry Perl Portable Edition!
* URL - http://www.strawberryperl.com/
* see README.portable.TXT for more info
-----
Perl executable: C:\myperl510\perl\bin\perl.exe
Perl version : 5.10.1
Microsoft Windows [Version 6.1.7601]
Copyright (c) 2009 Microsoft Corporation. All rights
reserved.
C:\Users\pmu>perl doc perllocal | find /I "Net::SSH2"
C:\Users\pmu>
```

Similarly, let's install another module, *Config::Tiny*. This is another handy module that allows you to have a nice *config* file, from which your scripts can pick up parameters, such as a *username*, a *password*, a *command* that you would want to run, or the location of a file:

```
C:\my32bitperl518>cpam Config::Tiny
--> Working on Config::Tiny
Fetching http://www.cpan.org/authors/id/R/R/RS/SAVAGE/Config-
Tiny-2.20.tgz ... OK
Configuring Config-Tiny-2.20 ... OK
```
