

Some Must-Have Android Apps for Sysadmins

Here are a number of Android apps that can actively assist a systems administrator.

A systems administrator has the job of setting up, running and maintaining the computer systems or the servers of an organisation for reliable service. This is a responsible and taxing task, and any tool that makes it easier is most welcome. In this article, the author discusses an array of apps that offer the sysadmin a number of benefits.

ConnectBot

ConnectBot is a powerful open source Secure Shell (SSH) client. It is a very handy tool for working on Linux/UNIX systems. Use it to connect to a computer via SSH and remotely control it. Once connected, you can enter commands as if you were sitting in front of the system, if access permissions have been set up earlier. It can manage simultaneous SSH sessions and create secure tunnels.

Features

- Supports logging in to any arbitrary server on the local network or the Internet with a user name and password.
- Supports connections based on a public/private key pair instead of the user name/password for increased security.
- Allows frequently accessed hosts to be saved in a menu for quick re-connection.

Fing

Fing is a customisable network discovery tool that finds out which devices are connected to a Wi-Fi network. A simple and intuitive interface helps evaluate security levels, detect intruders and resolve network issues. It also offers several networking utilities such as Ping, DNS Lookup and trace-out. All these can be used for troubleshooting and analysing connection issues.

Features

- Discovers all the devices connected to your Wi-Fi network.
- Displays the MAC address, device manufacturer and IP address.
- Has automatic DNS and reverse look-up.
- Service Scan allows you to scan hundreds of TCP ports in a few seconds.
- Supports identification based on the IP address, for bridged networks.
- Displays NetBIOS names and properties.
