

Figure 5: Screeplot

Figure 7: Loadings (variables) in a 2D plot

Figure 6: Scores (objects) in a 2D plot

Figure 8: Scores (objects) in a 3D plot

- cit (city block, Manhattan);
- cor (correlation);
- cos (cosine);
- euc (Euclidean);
- ham (hamming);
- jac (Jaccard);
- mah (Mahalanobis);
- min (Minkowski);
- seu (standardized Euclidean).

From *pdist*, *linkage* generates the data representing the hierarchical clustering. The available linking methods are:

- ave (average);
- cen (centroid);
- com (complete);

- med (median);
- sin (single);
- war (ward);
- wei (weighted).

Last, `H = dendrogram(Z,n)` plots the dendrogram with only the top 'n' nodes. By default, `n = 30` because, if the nodes are more than 30, the dendrogram may look a bit crowded. To display all the nodes, it's necessary to set `n = 0` (Figure 4).

```
clear;
sheets=readxls(uigetfile('*.xls'));
data=sheets(1).value;
dataS=wcenter(data,'r');
```
