

Figure 1: YP community

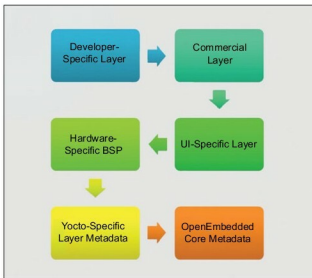

Figure 2: YP layers

—administrative and technical. The administrative board includes executive leaders from organisations that participate on the advisory board and also in several sub-groups that perform several non-technical services including community management, financial management, infrastructure management, advocacy and outreach. The technical board includes several sub-groups, which oversee tasks that range from submitting patches to the project architect to deciding on who is the final authority on the project.

The building of the project requires the coordinated efforts of many people, who work in several roles. These roles are listed below.

- **Architect:** One who holds the final authority and provides overall leadership to the project's development.
- **Sub-system maintainers:** The project is further divided into several sub-projects and the maintainers are assigned to these sub-projects.
- **Layer maintainers:** Those who ensure the components' excellence and functionality.

Latest updates

Yocto Project 1.6

The latest release of Yocto Project (YP) 1.6 'Daisy' has a great set of features to help developers build with a very good user interface. The Toaster, a new UI to the YP build system, enables detailed examination of the build output, with great control over the view of the data. The Linux kernel update and the GCC update to 4.8.2 adds further functionality to the latest release. It also supports building Python 3. The new client for reporting errors to a central Web interface helps developers to focus on problem management.

AMD and LG Electronics partner with Yocto

The introduction of new standardised features to ensure quick access to the latest Board Support Packages (BSP) for AMD 64-bit x86 architecture has made AMD a new gold member in the YP community. LG Electronics, joining as a new member organisation to help support and guide the project, is of great importance.

Embedded Linux Conference 2014

The Yocto Project is one of the silver sponsors of this premier vendor-neutral technical conference for companies and developers that use Linux in embedded products. Sponsored by the Linux Foundation, it has a key role in encouraging newcomers to the world of open source and embedded products.

Toaster prototype

Toaster, a part of the latest YP 1.6 release, is a Web interface for BitBake, build system. Toaster collects all kinds of data about the building process, so that it is easy to search and query through this data in a specific way.

- **Technical leaders:** Those who work within the sub-projects, doing the same thing as the layer maintainers.
- **Upstream projects:** Many Yocto Project components such as the Linux kernel are dependent on the upstream projects.
- **Advisory board:** The advisory board gives direction to the project and helps in setting the requirements for the project.

Layers

The build system is composed of different layers, which are the containers for the building blocks used to construct the system. The layers are grouped according to functionality, which makes the management of extensions and customisations easier.
