The CloudAnalyst cloud simulator

CloudAnalyst is another cloud simulator that is completely GUI-based and supports the evaluation of social network tools according to the geographic distribution of users and data centres.

Communities of users and data centres supporting the social networks are characterised and based on their location. Parameters such as user experience while using the social network application and the load on the data centre are obtained/logged.

CloudAnalyst is used to model and analyse real world problems through case studies of social networking applications deployed on the cloud.

The main features of CloudAnalyst are:

- User friendly graphical user interface (GUI)
- Simulation with a high degree of configurability and flexibility
- Performs different types of experiments with repetitions
- Connectivity with Java for extensions

The GreenCloud cloud simulator

GreenCloud is also getting famous in the international market as the cloud simulator that can be used for energy-aware cloud computing data centres with the main focus on cloud communications. It provides the features for detailed fine-grained modelling of the energy consumed by the data centre IT equipment like the servers, communication switches and communication links. GreenCloud simulator allows researchers to investigate, observe, interact and measure the cloud's performance based on multiple parameters. Most of the code of GreenCloud is written in C++. TCL is also included in the library of GreenCloud.

GreenCloud is an extension of the network simulator ns-2 that is widely used for creating and executing network scenarios. It provides the simulation environment that enables energy-aware cloud computing data centres. GreenCloud mainly focuses on the communications within a cloud. Here, all of the processes related to communication are simulated at the packet level. **END**
