

## Indonesia tax agency saves on expenses by using open source software!

According to a latest report published by the Indonesian Tax Agency, it has saved over 90 per cent on expenses because of the adoption of open source systems.

Low maintenance and the free licences of open source software play a major role in such high savings. The agency adopted open source software for most of the applications in 2002. Only some critical systems that need constant support run on proprietary software.

The complexity of the procurement process in Indonesia is another reason why the agency has adopted open source software, as open source doesn't come under a procurement process in the country. The agency is still using proprietary software for document management, but is planning to migrate to an open source document management system very soon.

## An open source foldable 3D printer has arrived!

3D printers help innovators and manufacturers to quickly build prototypes of their products. The industry is adopting 3D printing technology pretty rapidly. So, it's no wonder that innovators are coming up with better models of 3D printers. The latest TeeBotMax 3D printer is an example of such innovation—it is the world's first foldable 3D printer. Open source developers have built it. The printer is very simple to build, easy to transport and does not compromise on printing quality. TeeBotMax comes with a DIY guide to build the printer, for which a user doesn't need to be an expert.

The detailed PDF guide is available on open source community sites. There are even how-to YouTube videos to help you out. The material required to build TeeBotMax can be ordered from [www.3dstuffz.nl](http://www.3dstuffz.nl) or you can even pick it from the local hardware store. The printer is made up of an aluminium square pipe frame. The PDF guide includes a list of the required supplies. The printer is just 22.86-cm (9-inch) tall when folded and can produce up to a 14 cm high vase, for which it requires two-and-a-half hours. Flexible filaments can be used as material to print objects. However, this little printer makes a lot of noise while printing.

## UC Browser 10.0 available for download for Android

UC Browser 10.0 is now available for Android, and it can be downloaded via Google Play. This latest version offers a new UI, which has been adopted from Google's Material Design, which recently went live with Android 5.0 Lollipop. UC Browser 10.0 for Android offers simple settings and the navigation page has also undergone

## Latest version of Red Hat Software Collections now available

### software COLLECTIONS

Red Hat has announced the general availability of Red Hat Software Collections 1.2, which delivers the latest, stable versions of essential development tools, dynamic languages and open source databases, all on a separate lifecycle from Red Hat Enterprise Linux. The third instalment of Red Hat Software Collections now includes vital open developer tools such as GCC 4.9 and Git, and, for the first time, makes the Eclipse IDE available on Red Hat Enterprise Linux 7. In addition, Red Hat is offering Dockerfiles for many of the most popular software collections, aiding in the rapid creation and deployment of container-based applications. New additions to Red Hat Software Collections include: Red Hat Developer Toolset 3 as a software collection, bridging development agility and production stability with the latest stable versions of essential open development tools, including Itrace 0.7.91 and a number of other enhancements; devAssistant 0.9.1—a tool for setting up development environments and publishing code; Maven 3.0—a build automation tool for Java projects that describes how software is built and the associated dependencies; Git 1.9.4, which is now separate from the Red Hat Developer Toolset in its own collection that allows developers to access and install Git as a standalone, and many more.
