

Mozilla releases Firefox Developer Edition

Marking the 10th anniversary of the Firefox browser, Mozilla has released a new developer edition of Firefox, for Web developers, which will enable them to boost their productivity across multiple devices and platforms. The Firefox Developer Edition has a familiar UI and features, and the biggest change in it is its dark UI, which has been applied to the entire browser. If any developer is uncomfortable with this change, he can revert back to the familiar light theme through the *Customise* options, which are available at the bottom of the 'hamburger' menu. There, developers need to click on 'Use Firefox Developer Edition Theme'.

The key features of this first Developer Edition are WebIDE and Valence. The former is aimed at offering an integrated editor so that developers can work with Firefox OS apps in simulators, Firefox OS devices and also Firefox-for-Android devices. There is a debugger in the edition too, which allows one to pause and inspect components. Valence, on the other hand, supports WebIDE and allows connecting with Chrome-for-Android devices, Safari and iOS. It also lets developers inspect content on Chrome-for-Android devices, like debuggable WebView content in the KitKat OS and above. The new Firefox Developer Edition can be got from the Mozilla website itself; this edition is based on Firefox 35.0a2.

IBM expands cloud centre network

IBM has announced the opening of a 2,790 sq m cloud centre in Airoli, Mumbai. This new facility is the latest IBM cloud centre in one of the world's major markets and is part of the company's global expansion drive in this domain. The centre further expands IBM's global cloud footprint, which includes centres in London, Amsterdam, Beijing, Hong Kong, Singapore, Melbourne, Toronto, Dallas, Raleigh and Paris. Adoption of cloud computing worldwide is driven by the need for in-country data location to meet requirements for data sovereignty—a new form of customer demand. About 100 nations and territories have already adopted laws that dictate how governments and private enterprises handle personal data. As more data moves to the cloud, nations and territories worldwide are adopting data management laws to protect data held by businesses and governments.

Apple iPad has a LibreOffice-based document editor

LibreOffice has extended its reach now. A US-based company, CloudOn, has reportedly introduced a document editor for Apple iPad that is based on LibreOffice, which is free and open source. An official statement from the company has announced that the new app offers excellent features for creating and editing documents with a gesture-first document editor, which allows users to create new designs. The same company integrated Microsoft Office to mobile devices for the first time, which expanded mobile productivity for millions of people, said CEO and co-founder of CloudOn, Milind Gadekar. The gesture-first design allows more speed while creating and editing any document, and the app is compatible with MS Word, Dropbox, OneDrive, Google Drive and other cloud services.

Red Hat collaborates with SAP for next-gen mobile database development

Red Hat has announced new results of its collaboration with SAP to drive the next generation of mobile database development and synchronisation. Developers now have access to new components of the SAP data management

portfolio in OpenShift, Red Hat's award-winning Platform-as-a-Service (PaaS) offering. The mobile data management cartridge for the SAP SQL Anywhere suite makes it easier for developers creating MySQL-based database applications to extend their data to remote and mobile applications, and keep it synchronised. Red Hat and SAP are working together to provide a unique universal framework of database and application development technologies geared towards supporting a wide range of operating systems, languages and services, all within a cartridge, so users can quickly gain a competitive advantage and a return on their technology investments. With the cartridge for SAP SQL Anywhere on OpenShift, developers can rapidly develop database-powered, high-performing applications through automated workflows and tooling to help them access what they need, when they need it. The combination of OpenShift by Red Hat and SAP SQL Anywhere gives developers a choice-driven solution that is capable of handling large amounts of data. OpenShift
