

HostForLIFE.eu proudly announces Drupal 7.3 hosting

The ASP.NET spotlight hosting partner in Europe, HostForLIFE.eu, has announced the availability of new hosting plans that are optimised for the latest update of the Drupal 7.3 hosting technology. Drupal 7.3

The screenshot shows the HostForLIFE.eu website with a header navigation bar. The main content area is titled 'ASP.NET 4.5.2 Hosting' and features a table of four hosting plans. To the right of the table is an image of server racks. Below the table, there are four small icons representing different hosting services: Windows Shared Hosting, Windows Shared Cloud Hosting, Windows Dedicated Hosting, and Dedicated Cloud Server.

Windows Shared Hosting Plans	Windows Shared Cloud Hosting	Windows Dedicated Hosting Plans	Dedicated Cloud Server
€1.29 / month	€1.49 / month	€15.00 / month	€16.00 / month

is a free, open source Web development platform for online content and user communities. It is a free software package that allows customers to easily organise, manage and publish customer content. Drupal 7.3 is used by thousands of high profile websites and is subject to rigorous security testing, both by the Drupal community and by security experts around the world. It is a powerful solution that lets marketers and others build and manage sites, multi-channel digital experiences, shopping experiences, and integrate a diverse ecosystem of digital marketing and related tools and technology. Drupal is flexible, open, easy to integrate with, and easy to use for marketers and non-technical people - and it easily connects to marketing automation, CRM, email marketing, analytics, optimisation and other marketing technology solutions. HostForLIFE.eu is a popular online Windows-based hosting service provider. The company has managed to build a strong client base in a very short period of time. It is known for offering ultra-fast, fully-managed and secured services in the competitive market. Its powerful servers are especially optimised and ensure Drupal 7.3 performance. Drupal has perhaps the best data centres on three continents, unique account isolation for security, and 24/7 proactive uptime monitoring.

database includes a better sample QA form, fixing a number of bugs and issues that would annoy users. The most important is that call attempts are now filtered correctly. QueueMetrics 14.10 fully supports the upcoming Asterisk 13, which will be the core Asterisk LTS release coming out in the next months, as well as all other Asterisk versions. This release will initially come with Catalan localisation, and more languages are on their way.

Open source has a major role in data centre transformation

Large data centres are dynamically scalable, automated and have virtualised platforms for efficient access. Big enterprises need to adopt open systems for their infrastructure, as independent applications and workloads are their top priority. There has been a massive increase in the use of open source systems by cloud and service-based IT

models. Big organisations such as the Singapore Stock Exchange, Wall Street firms, and some global investment banks use open source infrastructure. But open source models are yet to penetrate beyond particular infrastructure layers. There are some challenges that every

evolving technology goes through. If some structural challenges are overcome, open source infrastructure can penetrate the market in coming years.

A panel of leading IT experts met in Singapore recently to discuss the challenges faced by open source infrastructure. Enterprises are leaning more towards open source as they are adopting the cloud within their infrastructure. This is mainly because, irrespective of the technology platform, SaaS (Software-as-a-Service) enterprises are concerned only about the output from their technology. Another reason is that the cloud involves the use of a large number of software segments, which one software vendor or enterprise cannot excel in. By mixing and matching environments and parts of different builds, software platforms have become the key to innovative development. And open source enables and promotes such collaborative type of development. The huge community that Linux and OpenStack have built is adding endless possibilities of innovation every other day.

Debian 9 and Debian 10 receive their code names

The names have been finalised and announced for the next two versions of the Debian operating system—Debian 9 and Debian 10. These two versions are

expected to arrive in the coming years. The code name for Debian 9 is Stretch and for Debian 10 is Buster. Earlier, no formal code names were ever announced for Debian releases, but it's time for change. These days, Debian users know the versions by their names mostly and not by numbers. For instance, users know the Wheezy One is quite stable,

while Jessie is still in its testing phase. The Debian 8.0 branch has been in the pipeline for some months now and is due for final release soon. The Debian team is also working on unblocking and fixing bugs, as per requests, and sixteen bugs still need their close attention.
