

When the above program is run, it will give the following result:

```
Connection to database successfully
Database mydb selected
Collection created successfully
```

Inserting a document

To insert a document into MongoDB, the *insert()* method is used:

```
<?php
// connect to mongodb
$m = new MongoClient();
echo "Connection to database successfully";
// select a database
$db = $m->mydb;
echo "Database mydb selected";
$collection = $db->mycol;
echo "Collection selected successfully";
$document = array(
    "title" => "MongoDB",
    "description" => "database",
    "likes" => 100,
    "url" => "http://www.mynosql.com/mongodb/",
    "by" , "My NoSQL Implementation"
);
$collection->insert($document);
echo "Document inserted successfully";
?>
```

The above program will give the following result:

```
Connection to database successfully
Database mydb selected
Collection selected successfully
Document inserted successfully
```

Finding all documents

To select all documents from the collection, the *find()* method is used:

```
<?php
// connect to mongodb
$m = new MongoClient();
echo "Connection to database successfully";
// select a database
$db = $m->mydb;
echo "Database mydb selected";
$collection = $db->mycol;
echo "Collection selected successfully";

$cursor = $collection->find();
```

```
// iterate cursor to display title of documents
foreach ($cursor as $document) {
    echo $document["title"] . "\n";
}
?>
```

When the above program is executed, it will display the following result:

```
Connection to database successfully
Database mydb selected
Collection selected successfully
{
    "title": "MongoDB"
}
```

Updating a document

To update a document, you need to use the *update()* method:

```
<?php
// connect to mongodb
$m = new MongoClient();
echo "Connection to database successfully";
// select a database
$db = $m->mydb;
echo "Database mydb selected";
$collection = $db->mycol;
echo "Collection selected successfully";
// now update the document
$collection->update(array("title"=>"MongoDB"), array('$set'
=>array("title"=>"MongoDB Implementation")));
echo "Document updated successfully";
// now display the updated document
$cursor = $collection->find();
// iterate cursor to display title of documents
echo "Updated document";
foreach ($cursor as $document) {
    echo $document["title"] . "\n";
}
?>
```

When the above program is executed, it will give the following result:

```
Connection to database successfully
Database mydb selected
Collection selected successfully
Document updated successfully
Updated document
{
    "title": "MongoDB Implementation"
}
```
