

Word processor integration

To cite an item from your library, in the manuscript, the word processor plugin needs to be added. Word processor plugins are available for MS Word, Libre Office, etc. After installing the plugin, a new toolbar is added under the **Add-INS** menu. To add a citation, click on the first icon, **Zotero – Insert citation**. The first time you begin working on any document, you will be prompted to select the citation style, as shown in Figure 6.

Once you have selected the citation style, the item that you want to cite is searched as selected from the search box (shown in Figure 7). Based on the citation style selected, either the numbers or authors' names will appear in the document.

You can insert the bibliography by clicking the **Zotero – Insert Bibliography** icon from the tool bar. The citation style is modified by clicking the **Document Preferences** icon. The citations can be deleted or modified as well. All the subsequent changes are automatically managed by Zotero.

Zotero Sync

Zotero provides the feature of syncing your library across multiple systems. The collection of items in your library is stored on the Zotero server. You need to log in and click on the **Sync with Zotero server** icon to perform the sync operation, which can be done from either the standalone or the add-on version.

Zotero groups

Zotero groups allow you to collaborate with people of similar interests and share resources with them. Groups facilitate sharing, collaboration and discovery among the members. The groups are of three types: public, open membership; public, closed membership; and private membership. The group settings can be chosen based on needs. Zotero allows modification of these settings. While some reference managers restrict the group management features in their free version, Zotero doesn't have any such restrictions. This becomes a significant factor while choosing Zotero as your favourite reference manager.

Zotero for developers

Developers can contribute towards enriching Zotero further in more than one way. The contributions could be:

- To develop a plugin to introduce new functionality. Detailed information about how to develop plugins can be gathered from https://www.zotero.org/support/dev/sample_plugin.
- To create a new citation style using Citation Style Language (CSL). Further information on this is available at https://www.zotero.org/support/dev/citation_styles
- To use the Zotero API in different applications to extend the utility of Zotero.
- To improve the Zotero client by bug-fixing or providing more features.
- To write Zotero translators that would improve the import

and export of metadata items from a variety of sources.

Non-developers can also contribute to Zotero by testing the tool, translating it to other languages, adapting it at their workplace or by simply spreading the word about it, which would be a great help for both the end users and the open source community. 

Acknowledgement

The author would like to acknowledge the support and encouragement offered by Dr G. Aghila, professor and head, Department of Computer Science & Engineering, National Institute of Technology Puducherry, Karaikal, in promoting the adoption of open source tools like Zotero among research scholars and students of higher classes.
