

Chrome 32 released

With the latest release from Google's kitty, there will be no more scrambling to find out which tab is playing that annoying piece of loud music or auto-playing any videos in the Chrome browser. Google has announced the release of Chrome 32, an updated version of its Web browser for Windows, Mac and Linux. Users can now upgrade to the latest release using the browser's built-in updater, or download it directly from google.com/chrome.

The new version includes tab indicators, a new look for Windows 8 Metro mode, and automatic blocking of malware downloads. Users can now visually scan their tabs for a speaker icon to quickly find the ones playing any sound in the background. Besides, the update also allows you to see which tabs are currently using the device's webcam. This addition has been a long time coming and is perhaps a boon for users annoyed by unwanted noise.

Windows 8 users who browse Chrome in Metro mode can now manage multiple Chrome windows and launch Chrome Apps from an integrated app launcher. Further, the company's Safe Browsing service has grown tougher, warning users about malicious websites and files. Also, users can now use a beta preview to help family members who may need some guidance in browsing the Web by creating supervised users. Simply create a supervised user, visit chrome.com/manage, and you can review their browsing activity as well as set site restrictions.

In addition, Chrome 32 now comes with lots of 'under the hood' changes for stability and performance and as many as 11 security fixes.

Now play games on WeChat!

In a bid to refine the gaming experience for users, WeChat has launched WeChat games. This new service on the all-in-one social communication application allows users to play games, share scores, post their achievements and compete with fellow WeChatters. The WeChat games version 5.1 release comprises four games—Gunz Dash, 2Day's Match, Craz3 Match and Pencil Pilot.

WeChat has also joined hands with AskMe. The latter has opened an official account on the chatting platform called AskMeSearch, using which users can go for local searches, deals and classifieds at their respective locations while remaining within WeChat.

Users can find games on WeChat and also download them from their respective app stores. These games are also enabled with location-based services, by which users can challenge their nearby friends and other users on WeChat.

Google is bringing Android into cars!

Google made an announcement that it will join hands with Audi, GM, Honda, Hyundai and Nvidia to create the Open Automotive Alliance. Google states that the new alliance is geared towards speeding up innovation in the automotive sector with an approach that offers openness, customisation and scale. This

'Ubuntu 12.04 LTS more secure than Mac and Windows!'

Ubuntu 12.04 LTS has topped a British intelligence agency's assessment of mobile and desktop operating systems, being the only operating system to fully pass nine of the 12 listed security recommendations. The Communications-Electronics Security Group (CESG), the information security arm of GCHQ (Government Communications Headquarters) in the UK, evaluated the security strengths and weaknesses of 11 of the most popular 'end user' OSs to offer practical advice on how government and public sector organisations should go about deploying devices that use them.

Google's Android, Apple's Mac OS X and Microsoft's Windows 7, 8 and RT were among the systems compared against a 12-point list of security criteria. Each OS was graded against parameters ranging from the proficiency of disc encryption and authentication, to the risk of malware, support for application sandboxing, and the secureness of VPN services. Ubuntu, along with Windows 8 and Mac OS X 10.8, has no 'significant risk' flag against it, confirms the report.

Ubuntu was marked down on VPN and encryption because its implementation/software has yet to be independently assessed by an approved CESG body. The VPN issue is expected to be addressed in time for the release of Ubuntu 14.04 LTS. Meanwhile, Canonical is seeking a sponsor to put the software through the assessment process with respect to encryption.

The report gave detailed information on the security of each OS' features, along with guidance for systems administrators on how best to set up and configure devices so that they meet the necessary governmental security standards.
