

the integrated and configurable full text search engine Lucene, improved internal system roles and organisational units to assign them to OpenCms workplace users, related resource management and advanced link management with the content relationship engine to keep internal links intact after move/rename operations. OpenCms also offers improved permission options and the 'switch user' function to be able to create complex permission scenarios, the restore (undelete) operation for deleted resources, WebDAV support to make content editing easier, the publish queue to simplify the procedure of publishing, improved context menus using Ajax technology, etc.

Apache Roller

A blog or weblog is a kind of public diary in which we write on various subjects that we want to publish and share with others, or in which we comment on ideas expressed by others. Roller is a multi-user and full-featured group blog server that allows users to create and maintain their own blogs and publish their ideas. Essentially, it is a Java Web application that should be able to run on almost any Java EE server such as GlassFish, Tomcat or JBoss and on relational databases such as MySQL, Postgres, etc. It was first written by Dave Johnson in 2002, for an article on open source development tools published in a tech magazine.

Roller is useful in organisations where it can support thousands of users and blogs, and hence it can be a useful tool for knowledge sharing. As a blogging tool, it is necessary to have a feature to moderate comments and manage spam prevention; it is also necessary to have complete control over the styling of the blog with the use of templates. Roller provides these features. A pluggable cache and rendering system and a built-in search engine that indexes weblog entries are also salient features of Roller. Oracle Blogs, NetBSD Project Blogs, Apache Blogs, Mervopolis Blogs, JWorld Taiwan, DZone's JRoller, Carleton University Library (Ottawa, Canada), etc, use Roller. There is a very good tutorial available to deploy Apache Roller on a Red Hat OpenShift public PaaS at <http://web-gmazza.rhcloud.com/blog/gmazza/entry/apache-roller-on-openshift>.

Magnolia

Magnolia is an open source CMS developed by Magnolia International Ltd, based on a content repository API for Java

Figure 4: Apache Roller

Figure 5: Magnolia dashboard

(JSR-283)—a specification for a Java platform API to access content repositories in a uniform manner. Its stable release is 5.2, which was published on November 22, 2013. Magnolia CMS is normally deployed as a standalone system, but it is possible to gain benefits such as scalability and higher availability by deploying it on cloud infrastructure such as Amazon EC2. Search functionality is provided by the Jackrabbit repository. The Responsive Web Design (RWD) to build websites that adapt to all devices and platforms is available, and so is the Standard Templating Kit (STK). The latter implements the RWD principles, which can deliver a browsing experience that works well on different types of clients such as browsers, smartphones,
